

# MASTER PATIENT INDEX/PATIENT DEMOGRAPHICS (MPI/PD) VISTA USER MANUAL

Version 1.0 April 1999

**Revised August 2011** 

Department of Veterans Affairs
Office of Information and Technology
Product Development

# **Revision History**

# **Document History**

The following table displays the revision history for this document. Revisions to the documentation are based on a continuous dialogue with the Common Services (CS) Technical Writers and evolving industry standards and styles.

Date	Description	Author
08/02/11	Two updates <u>not</u> generated from a patch release:  The appendix titled: "MPI/PD Business Rules" has been updated to remove the CMOR references and renamed to "MPI Glossary of Working Concepts."  Reviewed documentation to update for current organizational references and standards.	Susan Strack, Oakland OIFO; Christine Chesney, Birmingham OIFO; Gregory St. Julien (SPAWAR), Project Manager
12/17/10	Updates via Patch DG*5.3*825:  Added the following text to the PIMS screen captures listed below "User will be prompted for the Alias SSN if the Alias Name is added; however, the Alias SSN is optional.":  • Figure 7-1: No match found, patient is added to MPI  • Figure 7-2: Exact Match found on MPI. PATIENT file (#2) updated  • Figure 7-3: Load/Edit Patient Data—Add patient to PATIENT file (#2) and MPI for first time  • Figure 7-4: Load/Edit Patient Data—Select patient for processing already having ICN and CMOR  • Figure 7-5: Register a Patient- Add new patient, and connect to MPI for first time  • Figure 7-8: Computer dialogue displayed if MPI direct connection becomes unavailable	Susan Strack, Oakland OIFO; Christine Chesney, Birmingham OIFO; Gregory St. Julien (SPAWAR), Project Manager
07/2010	<ul> <li>Updates via Patch RG*1*57:</li> <li>MPI_CR1893(MPI_CodeCR1982) as they apply to this documentation:</li> <li>Upon logon to the system, members of the RG CIRN DEMOGRAPHIC ISSUES Mail Group now only see the one notification alerting users if there are Primary View Reject exceptions that need to be reviewed (Potential Matches Returned are obsolete).</li> <li>The "PMR Potential Match Rev" action has been removed from the MPI/PD Exception Handling [RG EXCEPTION HANDLING]</li> </ul>	Susan Strack, Oakland OIFO; Paulette Davis, Birmingham OIFO; Danila Manapsal, Oakland OIFO, Project Manager

	option.	
	All exceptions of type "Potential Matches Returned (218)" with the status NOT PROCESSED have been marked PROCESSED in the MPI/PD Exception Handling [RG EXCEPTION HANDLING] option.	
	<ul> <li>On the Management Reports menu, the Unresolved Exception Summary option now only shows totals for Primary View Reject exceptions.</li> </ul>	
	NOTE: The Potential Matches Returned exception in the VistA Exception Handler was made obsolete via VistA Patch MPIF*1*52 in that the logging of Potential Matches Returned exceptions was removed from the VistA HL7 message processor routines.	
11/2009	Final updates to documentation implementing feedback from Product Support (PS) for national release.	Susan Strack, Oakland OIFO; Danila Manapsal, Oakland OIFO, Project Manager
8/2009	<ul> <li>Updates via Patch RG*1*54:</li> <li>MPI_CR1680(MPI_CodeCR1736) The Display Only Query needs to be able to handle upper and lower case data entry. Updated the Display Only Query screen capture and descriptive text to reflect this.</li> </ul>	Susan Strack, Oakland OIFO; Chris Chesney, Birmingham OIFO; Danila Manapsal, Oakland OIFO, Project Manager
7/2009	MPI_CodeCR1713: Identity Management Data Quality (IMDQ) name change to Healthcare Identity Management (HC IdM).	Susan Strack, Oakland OIFO; Danila Manapsal, Oakland OIFO, Project Manager
7/2009	<ul> <li>Updates via Patch DG*5.3*712:</li> <li>Healthcare Identity Management (HC IdM) requested that BAD ADDRESS INDICATOR field (#.121) be added to the fields monitored and stored on the MPI for use by the matching logic. This VistA field has been added to the existing VistA field trigger mechanism.</li> <li>MPI_CR1502 (MPI_CodeCR1520) The Patient MPI/PD Data Inquiry option has been updated to display a Bad Address Indicator data, if available. This update is being released with Patch DG*5.3*712. The data is derived from the BAD ADDRESS INDICATOR field (#.121) in the PATIENT file (#2).</li> <li>A new style cross-reference has been added to the following three fields in the VistA PATIENT file (#2) so that when the field is edited, that information is included in the ADT/HL7 PIVOT file</li> </ul>	Susan Strack, Oakland OIFO; Chris Chesney, Birmingham OIFO; Tami Winn; Oakland OIFO; Danila Manapsal, Oakland OIFO, Project Manager
	(#391.71) in order to update the Master Patient Index:  - BAD ADDRESS INDICATOR (#.121)	

	<ul><li>EMAIL ADDRESS (#.133)</li></ul>	
	<ul><li>PHONE NUMBER [CELLULAR] (#.134)</li></ul>	
	Obsolete MPI Options Removed from the OPTION file (#19):	
	<ul> <li>Patient Data Review [VAFC EXCEPTION HANDLER]</li> </ul>	
	<ul> <li>Purge Patient Data Reviews [VAFC PDR PURGE]</li> </ul>	
	<ul> <li>Healthcare Identity Management (HC IdM) requested that AUDITING be turned on for the ALIAS (#2.01) multiple, and the ALIAS (#.01) and ALIAS SSN (#1) fields in the PATIENT file (#2).</li> </ul>	
	<ul> <li>Identity Management Data Quality (IMDQ) name change to Healthcare Identity Management (HC IdM).</li> </ul>	
1/2009	MPI_CR1073(MPI_CodeCR1429): 3.2.2 - Master Patient Index/Patient Demographics (MPI/PD) VistA Enhancements released with Patch MPIF*1*52:	Susan Strack, Oakland OIFO; Danny Reed,
	<ul> <li>Prevent logging of local exceptions for potential matches.</li> </ul>	Birmingham OIFO; Danila Manapsal,
	<ul> <li>Auto-resolve existing VistA Potential Match exceptions.</li> </ul>	Oakland OIFO,
	<ul> <li>Remove from the MPI/PD Exception Handler the action for resolving a Potential Match Exception and all associated screens and actions. This functionality will be supported by the IMDQ Toolkit.</li> </ul>	Project Manager
1/2009	MPI_CR1024 (MPI_CodeCR1381): Enhancement Display Only Query Display–IMDQ reported that place of birth state is showing up with the gender on the display only query when there isn't a place of birth city released with Patch MPIF*1*52. Updated the following screen captures in the Display Only Query option (Edits in Red in the manual):	Susan Strack, Oakland OIFO; Chintan Naik, Dallas OIFO; Danila Manapsal, Oakland OIFO, Project
	<ul> <li>Figure 5-40: Display Only Query when Patient exists in Patient File</li> </ul>	Manager
	<ul> <li>Figure 5-41: Display Only Query when patient does not exist in PATIENT file (#2)</li> </ul>	
	<ul> <li>Figure 5-42: Display Only Query with an Open Data Management Case</li> </ul>	
6/2008	Patch RG*1*52 makes the following changes in the MPI/PD software:	Susan Strack,
	MPI/PD Patient Admin User Menu Removed	Oakland OIFO; Paulette Davis,
	The MPI/PD Patient Admin User Menu [RG ADMIN USER MENU] was distributed with patch RG*1.0*49 (released 4/10/08) as obsolete with an Out of Order message. This option is being distributed in this build as DELETE AT SITE in order to remove it from the menu structure. There are other MPI/PD options in the MPIF* and VAFC* namespaces that are also obsolete that will be removed in future MPIF* and DG* patches.	Birmingham OIFO; Danila Manapsal, Oakland OIFO, Project Manager
	<ul> <li>The following Date of Death exceptions in the MPI/PD Exception Handler have been made obsolete:</li> </ul>	

	<ul> <li>Exception Type: Death Entry on MPI not in VISTA.         Description: MPI had Date of Death field populated. Vista did not have Date of Death.     </li> <li>Exception number: 215.</li> <li>Exception Type: Death Entry on Vista not in MPI.         Description: VISTA had Date of Death field populated. MPI did not have Date of Death.     </li> </ul>
	Exception number: 216.  - Exception Type: Death Entries on MPI and Vista DO NOT Match.  Description: MPI and VistA had different dates of death for this patient.  Exception number: 217.
	REMOTE DATE OF DEATH INDICATED Bulletin Made Obsolete:
	- The Remote Date of Death Indicated notification message generated from the MPI has been made obsolete. This bulletin indicated that the patient had a date of death entered from the sending site but not at the receiving site.
	Obsolete Data Removed from the Unresolved Exception Summary report:
	Data referencing the Patient Data Review and CMOR Requests Status has been removed from the Unresolved Exception Summary report. Those issues were made obsolete in earlier patches.
4/2008	As of Patch RG*1*49 and DG*5.3*766, the Patient Data Review option has been disabled by placing the MPI/PD Patient Admin User Menu Out of order.  Susan Strack, Oakland OIFO; Paulette Davis, Birmingham OIFO; Danila Manapsal, Oakland OIFO, Project Manager
3/2008	As of Patch DG*5.3*756, the ALIAS [#1] multiple in the PATIENT (#2) file will be updated in VistA resulting from the edits made to that information on the MPI by the IMDQ team. The VistA data will be synchronized to match the MPI values. Additionally, when a facility revises their local ALIAS data, the information will be transmitted to the MPI, which in turn will update all treating facilities where the patient is known.  NOTE: Patch DG*5.3*756 was released on September 6, 2007.
1/2008	A Remote Procedure Call (RPC) sends a request for data to the Master Patient Index (MPI) from VistA for the Primary View Display from MPI [RG PRIMARY VIEW FROM MPI] option, the View PV Rej Detail (PVR) action, and the MPI Primary View (PR) action on the MPI/PD Exception Handling [RG EXCEPTION HANDLING] option. This RPC has been updated in Patch RG*1*53 to allow the query to be resent when delays are encountered.

12/2007	These are the Release Notes for Patch RG*1*50, which reflects Identity Management Data Quality's (IMDQ) request that the MPI/PD Exception Purge option, [RG EXCEPTION PURGE], be changed to process Primary View Reject exceptions similar to other MPI/PD exception types. Now, the purge job RG EXCEPTION PURGE eliminates duplicate exceptions for the same patient/exception type for all MPI/PD exception types, keeping only the most recent occurrence.	Susan Strack, Oakland OIFO; Paulette Davis, Birmingham OIFO; Danila Manapsal, Oakland OIFO, Project Manager
8/2007	Documentation updates for the Patches RG*1*48 and MPIF*1*48, including functionality from Patch DG*5.3*756, which is part of the Master Patient Index (MPI) Changes Project, Iteration 4.  • VA facilities now have the ability to remotely view Primary View patient identity fields on the Master Patient Index (MPI). This information is available on the MPI in the MPI Patient Data Inquiry [MPI DATA MGT PDAT MPI] option. The report generated by this option displays the current activity scores for individual patient identity fields (i.e., Primary View of the MPI).  • In the Primary View of the MPI, the ALIAS multiple (#50) is stored in the MPI VETERAN/CLIENT file (#985). In VistA, the ALIAS multiple (#1) is stored in the PATIENT file (#2). All edits made by Identity Management Data Quality (IMDQ) staff to any of the fields in the ALIAS multiple on the MPI via the Edit PV Alias Values [MPI DATA MGT EDIT PV ALIAS] option, including any pre-existing alias data in that same patient entry that was not edited, is sent to the Primary View of the MPI and now synchronized out to all systems of interest (e.g., VistA treating facilities) for that patient. Site updates to the ALIAS multiple (#1) in the VistA PATIENT file (#2) will be updated in VistA and synchronized to match the MPI values. Additionally, when a VA facility updates their local ALIAS data, the information is sent to the Primary View of the MPI and synchronized back out to all other treating facilities (systems of interest) in which that patient has been seen for care.  • The CIRN HL7 EXCEPTION LOG file (#991.1) has been modified to record VA facility personnel who use the MPI/PD Exception Handling option to resolved exceptions and the date/time the resolution occurred. Patch RG*1*48 adds the following new fields to File #991.1:  • DATE/TIME PROCESSED field (#7)  • WHO MARKED PROCESSED field (#8)  This data is now being captured and Identity Management Data Quality (IMDQ) staff will have the capability to view this information.  • A change has been made in the MPI/P	Susan Strack, Oakland OIFO; Danny Reed, Paulette Davis, Chris Chesney, Chris Link, and Dan Ihlenfeld, all from Birmingham OIFO; Dan Soraoka, Oakland OIFO, Project Manager

		I
	once the job is finished, you can go back to the Message Exception Menu and choose MPI/PD Exception Handling to view the results of the purge process.	
	<ul> <li>A stand-alone option named View VistA Exceptions for Patient [MPI DATA MGT VISTA EXCEPTION] has been implemented on the MPI in Austin for the Identity Management Data Quality (IMDQ) team allowing them to query a VistA site for a selected patient and view all the existing VistA exceptions for a given date range. The VistA side support for this new MPI option came in as part of Patch RG*1*48.</li> </ul>	
4/2007	As of Patch DG*5.3*707, the following enhancements were made to the Patient MPI/PD Data Inquiry [RG EXCEPTION TF INQUIRY] option:	Susan Strack, Oakland OIFO; Chris Link,
	<ul> <li>Display SSN Verification and Pseudo SSN Reason.</li> </ul>	Birmingham OIFO; Paulette Davis,
	<ul> <li>Remove the call to calculate CMOR score and remove the display of CMOR Score and Subscription Control Number.</li> </ul>	Birmingham OIFO; Dan Soraoka,
	Modify format of display.	Oakland OIFO, Project Manager
3/2007	As of Patches MPIF*1*46 and RG*1*44, this documentation has been updated to reflect the following:	Susan Strack, Oakland OIFO; Danny Reed,
	Patch MPIF*1*46:	Birmingham OIFO;
	<ul> <li>Processing to account for the HL7 PID segment message being greater than 245 characters.</li> </ul>	Paulette Davis, Birmingham OIFO;
	<ul> <li>Resume correct prompting for identity fields in the first part of PIMS Registration options for new patients.</li> </ul>	Chris Chesney, Birmingham OIFO; Dan Ihlenfeld,
	<ul> <li>Updated screening to prevent Primary View Reject exceptions from entering the Potential Matches Returned logic.</li> </ul>	Birmingham OIFO; Dan Soraoka, Oakland OIFO,
	<ul> <li>Changed exception text for the new Primary View Reject exception.</li> </ul>	Project Manager
	Patch RG*1*44:	
	<ul> <li>Functionality incorporated into the MPI/PD Exception Handling RG EXCEPTION HANDLING option to automatically process the "Primary View Reject" exceptions. Name change for exception action that processes reject exceptions "PVR View PV Rej Detail."</li> </ul>	
	<ul> <li>MPI/PD Exception Purge process updated. For every date that an exception occurs for a patient, the exception occurs in the Exception Handler for review. However, if more than one active Primary View Reject exception occurs during the same day for the same patient, the purge will remove the duplicate occurrences, leaving only the most recent.</li> </ul>	
	<ul> <li>Alias Social Security Numbers included in the HL7 ADT-A31 update message.</li> </ul>	
	<ul> <li>Processing to ensure that pending updates to the Primary View waiting in the ADT/HL7 PIVOT file (#391.71) are not lost in IMDQ</li> </ul>	

	override process.	
1/2007	<ul> <li>As of Patches MPIF*1*44 and RG*1*45, this documentation has been updated to reflect the following:</li> <li>The concept of a "CMOR facility" is being phased out and will be replaced by the Primary View when Patch MPI*1*40 is installed on the Austin MPI. VistA Patch MPIF*1*44 sets all VistA options related to "CMOR" out of order, rendering them obsolete. The OUT OF ORDER MESSAGE field for these options is marked as "Obsolete with Patch MPIF*1*44."</li> <li>As of Patch MPIF*1*44, the Site Parameters Edit for CMOR [MPIF SITE PARAMETER] option, located on the MPI/PD Patient Admin Coordinator Menu, is obsolete and has been placed out of order.</li> <li>As of Patch MPIF*1*44, the AUTO CHANGE CMOR NIGHT JOB [MPIF CMOR REQUEST AUTO JOB] option is obsolete. Sites that have this option scheduled to run via TaskMan, should unschedule it.</li> <li>SSN VERIFICATION STATUS field (#.0907) is now synchronized out to Sites when updated by Enrollment System Redesign (ESR) as of Patch RG*1*45.</li> </ul>	Susan Strack, Oakland OIFO; Danny Reed, Paulette Davis, Chris Chesney, and Dan Ihlenfeld, Birmingham OIFO; Dan Soraoka, Oakland OIFO, Project Manager
4/2006	Updated documentation based on VistA Patch DG*5.3*707. Changed the Patient MPI/PD Data Inquiry option display:  • Added SSN Verification and Pseudo SSN Reason  • Remove call to calculate CMOR score and remove display of CMOR Score and SCN	Susan Strack, Oakland OIFO; Christine Link, Birmingham OIFO; Dan Soraoka, Oakland OIFO, Project Manager
4/2006	Updates to documentation based on Patches MPIF*1*43 and RG*1*43, which comprise the changes to the MPI/PD software resulting from the Health Eligibility Center (HEC) Enumeration to the Master Patient Index (MPI).	Susan Strack, Oakland OIFO; Christine Chesney and Paulette Davis, Birmingham OIFO; Dan Soraoka, Oakland OIFO, Project Manager
4/2005	<ul> <li>Updated documentation based on Patch MPIF*1*37 as follows:         <ul> <li>Included new "Appendix I: Change To Identity Management Fields, Patch MPIF*1*37"</li> <li>Updated all affected screen captures from Patch MPIF*1*37.</li> </ul> </li> <li>Corrected test data for patient name.</li> <li>Corrected screen captures for misplaced prompts:         <ul> <li>PATIENT SERVICE CONNECTED?:</li> <li>PATIENT MULTIPLE BIRTH INDICATOR:</li> </ul> </li> </ul>	Susan Strack, Oakland OIFO, Paulette Davis, Birmingham OIFO
12/2004	Implemented new conventions for displaying TEST data. See	Susan Strack,

	Orientation section for details.	Oakland OIFO
5/2004	MPI/PD VistA Version 1.0 User Manual released in conjunction with patches MPIF*1*33, RG*1*35 and DG*5.3*589 to support the MPI Changes Iteration 2 project.	Susan Strack, Oakland OIFO; Christine Chesney, Christine Link, and Paulette Davis, Birmingham OIFO
12/2003	Updates to documentation based on Patches RG*1*29 and DG*5.3*479.	Susan Strack, Oakland OIFO; Lauren Hardeen, Bay Pines OIFO
6/2003	MPI/PD VistA Version 1.0 User Manual released in conjunction with patches DG*5.3*505, and MPIF*1*28 of the MPI Changes Iteration I project.	Lauren Hardeen, Bay Pines OIFO; Susan Strack, Oakland OIFO
4/1999	Initial MPI/PD and MPI VistA User Manuals were created for release with the MPI/PD V.1.0 software in April 1999.	Dianne Barker, Silver Spring OIFO; Susan Strack, Oakland OIFO

#### How to Use this Manual

This manual uses several methods to highlight different aspects of the material. The following symbols are used in the manual to alert the reader about special information:

Various symbols are used throughout the documentation to alert the reader to special information. The following table gives a description of each of these symbols:

Symbol	Description
1	<b>NOTE:</b> Used to inform the reader of general information including references to additional reading material
A	CAUTION: Used to caution the reader to take special notice of critical information

**Table 1-2: Documentation Symbol Descriptions** 

- Descriptive text is presented in a proportional font (as represented by this font).
- "Snapshots" of computer online displays (i.e., character-based screen captures/dialogs) and computer source code are shown in a *non*-proportional font and enclosed within a box. Also included are Graphical User Interface (GUI) Microsoft Windows images (i.e., dialogs or forms).
  - User's responses to online prompts will be boldface type.
  - The "**<Enter>**" found within these snapshots indicate that the user should press the Enter or Return key on their keyboard.
  - Author's comments are displayed in italics or as "callout" boxes.
  - **NOTE:** Callout boxes refer to labels or descriptions usually enclosed within a box, which point to specific areas of a displayed image.
- All uppercase is reserved for the representation of M code, variable names, or the formal name of options, field and file names, and security keys (e.g., the XUPROGMODE key).
- Conventions for displaying TEST data in this document are as follows:
  - The first three digits (prefix) of any Social Security Numbers (SSN) will begin with either "000" or "666".
  - Patient and user names will be formatted as follows:

[Application Name]PATIENT,[fictitious given name] and [Application Name USER, [fictitious given name] respectively

The "Fictitious given name" represents a fabricated given name for the patient or user. This is done to more clearly represent patient and user names used in descriptive text in this documentation. For example, for the Master Patient Index (MPI) test patient and user names would be documented as follows: MPIPATIENT,NANCY; MPIPATIENT,SAM; MPIPATIENT,DEBRA; etc. and MPIUSER,RICH; MPIUSER,JOHN; etc.

### Who Should Read this Manual?

This manual has been written with many job functions in mind. Personnel responsible for registering patients, data integrity, Patient Information Management System (PIMS) Automated Data Processing Application Coordinators (ADPACs), and IRM personnel involved with using all aspects of the Master Patient Index (MPI) should read this manual. If you need more information, it is suggested that you look at the various Office of Enterprise Development - VistA & Healthe Vet Development Web pages for a general orientation to VistA at this address:

http://vaww.vista.med.va.gov

#### **Reference Materials**

In order to competently operate this package you must be familiar with the operations of the VistA computer system, in general. This information can be obtained at the Office of Enterprise Development - VistA & Healthe Vet Development Web site:

http://vaww.vista.med.va.gov

Readers who wish to learn more about the Master Patient Index/Patient Demographic (MPI/PD) software should consult the following Web sites:

• VA Software Document Library at the following address:

http://www.va.gov/vdl/application.asp?appid=16

The MPI/PD VistA product documentation, as found at the link above, includes the following manuals:

- Master Patient Index/Patient Demographics (MPI/PD) VistA User Manual
- Master Patient Index/Patient Demographics (MPI/PD) VistA HL7 Interface Specifications
- Master Patient Index/Patient Demographics (MPI/PD) VistA Technical Manual
- Master Patient Index/Patient Demographics (MPI/PD) VistA Exception Handling
- Master Patient Index/Patient Demographics (MPI/PD) VistA Programmer Manual
- Master Patient Index (MPI) VistA Monograph

Also see the following VistA Duplicate Record Merge product documentation, found at the following link http://www.va.gov/vdl/application.asp?appid=2, includes the following manuals:

- Duplicate Record Merge: Patient Merge Release Notes for Kernel Toolkit Patch XT\*7.3\*113.
- Duplicate Record Merge: Patient Merge User Manual, Version 7.3, Patch XT\*7.3\*113

- Duplicate Record Merge: Patient Merge Technical Manual, Version 7.3, Patch XT\*7.3\*113
- Master Patient Index (MPI) Web site:

http://vista.med.va.gov/mpi/index.asp

Healthcare Identity Management (HC IdM) team at:

http://vista.med.va.gov/mpi\_dqmt/

Security & Other Common Services at:

http://vista.med.va.gov/iss/

VistA documentation is made available online in both Microsoft Word format and Adobe Acrobat Portable Document Format (PDF). It can be downloaded from the VHA Software Document Library Web site at:

http://www.va.gov/vdl/

#### **Installation Information and Procedures**

The Master Patient Index VistA and Patient Demographics (PD) were distributed and installed together. All installation information and procedures involved with the MPI VistA is included in the CIRN Patient Demographics (CIRN-PD) Pre-Installation and Implementation Guide v.5 document:

**NOTE:** One of the major pre-implementation tasks is the merging of duplicate patient records at a site. The "Duplicate Record Merge: Patient Merge (Patch XT\*7.3\*23) User Manual" is required for this task. Patches XT\*7.3\*49, RG\*1\*6, and RG\*1\*10 allow sites with MPI/PD to resolve duplicate records. If you do not have these patches installed, it is recommended that the option to merge patient records be placed out of order.

#### Interaction Between MPI/PD and Other Packages

Because of the close interaction between MPI/PD and other packages, you may also find it helpful to review the documentation for the following VistA software:

- VistA *HL7 V. 1.6*
- PIMS V. 5.3 Admission, Discharge and Transfer (ADT)

VistA documentation is made available online in Microsoft Word format and in Adobe Acrobat Portable Document Format (PDF). Adobe Acrobat Portable documents must be read using the Adobe Acrobat Reader (i.e., ACROREAD.EXE), which is freely distributed by Adobe Systems Incorporated at the following web address:

http://www.adobe.com/

## **How to Obtain Technical Information Online**

Exported VistA M-based file, routine, and global documentation can be generated using Kernel, MailMan, and VA FileMan utilities.

**NOTE:** Methods of obtaining specific technical information online will be indicated where applicable under the appropriate topic.

#### **Help at Prompts**

VistA M-based software provides online help and commonly used system default prompts. Users are encouraged to enter question marks at any response prompt. At the end of the help display, you are immediately returned to the point from which you started. This is an easy way to learn about any aspect of VistA software.

#### **Obtaining Data Dictionary Listings**

Technical information about VistA M-based files and their associated fields is stored in data dictionaries. You can use the List File Attributes option on the Data Dictionary Utilities submenu in VA FileMan to print formatted data dictionaries.

**NOTE:** For details about obtaining data dictionaries and about the formats available, please refer to the "List File Attributes" chapter in the "File Management" section of the *VA FileMan Advanced User Manual*.

DISCLAIMER: The appearance of external hyperlink references in this manual does not constitute endorsement by the Department of Veterans Affairs (VA) of this Web site or the information, products, or services contained therein. The VA does not exercise any editorial control over the information you may find at these locations. Such links are provided and are consistent with the stated purpose of the VA.

# Chapter 1: Introduction

# **Overview of Master Patient Index/Patient Demographics**

Master Patient Index/Patient Demographics (MPI/PD) was developed to initialize active patients to the Master Patient Index (MPI) and to establish the framework for the sharing of patient information between sites. During the process of initialization to the Master Patient Index, each active patient received:

- An Integration Control Number (ICN)
- A Coordinating Master of Record (CMOR)
- A Treating Facility List of sites where the patient is also known by this ICN

Each site becomes part of the network of sites that share key demographic data for patients via HL7 messaging, Master Patient Index VistA (MPI) and Patient Demographics (PD) were distributed and installed together. This manual covers the functionality of both packages.

The objectives of the MPI/PD VistA are to:

- Create an index that uniquely identifies each active patient treated by the Veterans Administration.
- Identify the sites where a patient is receiving care.

This is crucial to the sharing of patient information across sites.

Master Patient Index Patch MPI\*1\*40 constituted a change in the business process that updates the patient identity fields across VA facilities. Patch MPI\*1\*40 phased out the use of the facility Coordinating Master of Record (CMOR) concept, and introduced the Primary View methodology. Primary View is an enterprise view of the most current data for a patient based on authority scoring and the latest data rules.

### **History**

MPI/PD was originally part of the Clinical Information Resource Network (CIRN) project. CIRN was to be a three-phase project consisting of Phase 1: Pre Implementation (site cleanup), Phase 2: Master Patient Index/Patient Demographics (Master Patient Index seeding for VHA-wide patient identification and patient demographics synchronization), and Phase 3: CIRN Clinical Repository. Master Patient Index/Patient Demographics is now a separate, independent package. Due to its beginnings, you will still notice references to CIRN (e.g., shared name and number spaces, file names, package terminology, etc.). The clinical repository is now a separate, independent project called Health Data Repository (HDR).

**NOTE:** During the 1980s, the policy for creating patients in the PATIENT file (#2) that were also employees was to enter them as EEE followed by their social security number (SSN). That policy was subsequently revoked but did not include any cleanup of the existing EEE patients. During the implementation phase of the Master Patient Index/Patient Demographics (MPI/PD) application, a report was generated to identify these patients. Some of them were changed to

their correct names, but many still had not been resolved. It was possible for these EEE patients to be assigned an ICN, either local or national. Since this data does not assist in the identification or sharing of patient data, it was decided that these patients should not be assigned an ICN of any kind, nor should an exception be logged that they have been touched. Prior to Patch MPIF\*1\*33, patients who had both an "EEE" as the first three characters of their last name and an ICN (local or National) were inactivated (following the rules for inactivation) from the MPI during the post initialization for Patch MPIF\*1\*21. These EEE patients were included in the screen of patients *not* to be sent to the MPI.

This screen on EEE patients was reviewed again in the MPI Changes 2 project and removed in Patch MPIF\*1\*33. Patients with last names beginning with "EEE" will no longer be screened from getting a local or national ICN. In addition, no exception message will be logged in the local VistA exception handler when these patient entries are touched.

#### Distinguishing MPI (Austin) from MPI/PD (VistA)

MPI (Austin) refers to the actual index located at the Austin Corporate Franchise Datacenter (CFD). MPI/PD (VistA) refers to the software that resides in VistA at sites and sends patient data to the MPI (Austin). These terms [i.e., MPI (Austin) and MPI/PD (VistA)] are used throughout this manual only when it is not obvious which component of the MPI the documentation is referring. Otherwise, the reader should assume the information is referring to MPI/PD (VistA).

# MPI Identity Hub for the Healthcare Identity Management (HC IdM) Team

As of the release of MPI/PD Patches MPIF\*1\*52 and RG\*1\*54, the MPI Identity Hub for Healthcare Identity Management (HC IdM) was implemented enabling the change from the current MPI patient deterministic lookup to an Identity Hub based probabilistic patient lookup.

Initiate was purchased to be integrated with the MPI and Person Service Identity Management (PSIM) for the purpose of improving the matching of patients and persons across VHA. PSIM will serve as the interface to the commercial Identity Management system and the MPI will interact with PSIM.

The Initiate centralized probabilistic search algorithm will replace the local VistA KERNEL DUPLICATE RECORD MERGE search process for identifying local potential duplicate PATIENT file (#2) records. When the search algorithm identifies potential duplicates, they are automatically added to the VistA DUPLICATE RECORD file (#15).

**NOTE:** For more information on the VistA DUPLICATE RECORD MERGE release, please refer to Kernel Toolkit Patch XT\*7.3\*113.

## **Installation Information**

The Master Patient Index VistA and Master Patient Index/Patient Demographics (MPI/PD) were distributed and installed together. All installation information and procedures involved with MPI have been referenced in the following MPI/PD documents:

- CIRN Patient Demographics (CIRN-PD) Pre Installation and Implementation Guide V. 5
- Master Patient Index/Patient Demographics (MPI/PD) Installation and Implementation Guide V.

In October 2002, the three-phase release of patches for the MPI/PD VistA software enhancement began. Phase I consisting of three patches, contains the protocols and routines to execute a new messaging structure. The overall objective of the new messaging is to reduce the amount of facility-to-facility messaging by using the Master Patient Index (MPI), rather than the CMOR, as the source for update messages.

The second phase of patches updates the necessary routines to call the new trigger events using the updated messaging structure. The trigger events include the following:

- Add new patient to the MPI.
- Link to an existing patient on the MPI.
- Update to non-key fields on an existing MPI entry.
- Update to key fields on an existing MPI entry.
- Update to date last treated.
- Resolution of duplicates at the site where both entries exist on the MPI.
- Resolution of duplicates on the MPI.
- Identification and resolution of a mismatched patient.
- Inactivation of existing entry on the MPI.

This phase also includes a data synchronization process to populate new fields in the MPI FACILITY ASSOCIATION file (#985.5) on the MPI for each facility associated with a national integration control number (ICN). Before this is done though, all facilities must install the patches for the second phase.

The third phase of patches contains additional messaging functionality that cannot be implemented until the synchronization process has completed. This final group of patches will clean up obsolete routines, protocols, and options that are no longer used.

Introduction

# Chapter 2: Product Description What Comprises the Master Patient Index?

# **Master Patient Index (Austin)**

The Master Patient Index (MPI) is located at the Austin Information Technology Center (AITC). It is composed of a unique list of patients and an associated list of VAMCs (Veterans Affairs Medical Centers) and other systems of interest where each patient has been seen. This enables the sharing of patient data between operationally diverse systems. Each patient record (or index entry) on the MPI contains multiple demographic fields which are updated to the Primary View of the MPI.

NOTE: For a list of the fields stored on the MPI, see the section titled: "Appendix D: Data Stored on the MPI in Austin" in this documentation.

When a patient is first presented into the MPI for an Integration Control Number (ICN) assignment, that patient's identifying information (i.e., name, Social Security Number (SSN), date of birth, gender, mother's maiden name, multiple birth indicator, place of birth city and state) is passed to the MPI. The MPI checks to see if an exact match on Name (first and last), SSN, date of birth, and gender is found. A check is also made to see if the patient's internal entry number (DFN) from the querying site is already known to the MPI. If so, this is also considered an exact match. If an exact match is found, the ICN, and ICN Checksum are returned to the requesting site. The requesting site is added to the list of treating facilities (TF) in which this patient has been seen and the updated list is broadcasted to all systems of interest, including VAMCs.

If an exact match is not found, the MPI returns a message indicating this. The patient entry is then added to the MPI. If a potential match is found, a potential match exception is logged for the HC IdM group to review, the patient is still added to the MPI.

**NOTE:** The term "systems of interest" refers to VA facilities that have seen patients and entered them as entries onto the MPI. This also refers to non-VistA systems that have a registered interest in a patient (e.g., Federal Health Information Exchange [FHIE], HomeTeleHealth, Person Service Identity Management [PSIM], Health Data Repository [HDR], etc).

## HC IdM Team is Data Steward for the Master Patient Index (MPI)

The Healthcare Identity Management (HC IdM) team is the Data Steward for the Master Patient Index (MPI). They have the ability to perform the following functions on the Primary View of the MPI:

- View and/or edit the authority values for the Primary View business rules criterion.
- Override Primary View identity traits for selected identity fields in the MPI VETERAN/CLIENT file (#985) and broadcast the new Primary View out to the systems of interest.

• View the Primary View Reject Report from the data in the MPI REJECTED UPDATE file (#985.65).

**NOTE:** Data on this report is a duplicate of the same information generated in the Reject Exceptions report at the sites.

# **Master Patient Index/Patient Demographics (VistA)**

The Master Patient Index/Patient Demographics (MPI/PD) software resides in VistA enabling sites to:

- Request an ICN assignment
- Resolve a potential duplicate on the MPI.
- Review and process exceptions received from MPI including Primary View Reject exceptions.
- Ouery the MPI (Austin) for known data.
- Update the MPI when changes occur to demographic fields stored on the MPI or of interest to other facilities/systems of interest.

### Requesting an ICN Assignment

During the initialization of the MPI database in Austin, each VA Medical Center sent batch HL7 messages to the MPI (Austin) requesting ICNs for all of its patients whose records reflected activity in the past three fiscal years (i.e., active patient records).

In day-to-day operations, patients are presented to the MPI via:

- PIMS options:
  - Load/Edit Patient Data
  - Register a Patient
  - Electronic 10-10EZ Processing
- Local/Missing ICN Resolution background job

When a new patent record is created via the PIMS options, a real-time connection is established to the MPI requesting an ICN assignment. If communication cannot be established or is lost with the MPI before the ICN assignment process has completed, a local ICN is assigned. Otherwise, a national ICN is assigned to the patient. The ICN can either be newly created or already on the MPI for that patient. The ICN, ICN checksum, and list of facilities, including other systems of interest (e.g., FHIE and HDR), are updated in the site's VistA system.

If an existing patient record is edited via the PIMS options, and if this patient does not have an ICN (national or local), the same process occurs as was illustrated for a newly created patient.

If a patient record is edited or created outside of the PIMS options, they are presented to the MPI for ICN assignment via the Local/Missing ICN Resolution background job.

If an exact match is not found the MPI returns a message indicating this and that the patient is being added to the MPI. If potential matches are found, a new ICN is assigned to the patient, and an exception is logged for the Health Care Identify Management (HC IdM) group to review and provide the appropriate action. If the patients are truly the same person, then the records will be linked together with one ICN becoming the primary ICN that all records will be linked under and the other will be deactivated. The sites that had the deactivated ICN will be updated to the primary ICN.

NOTE: As of MPI/PD Patch MPIF\*1\*52, all screens and actions associated with the MPI/PD Exception Handler functionality for resolving Potential Match Exceptions have been removed from MPI/PD VistA. This functionality is now supported in the IMDQ Toolkit.

**NOTE**: MPI/PD updates as of VistA Patches MPIF\*1\*43 and RG\*1\*43:

- The only times local ICNs are assigned to patient records are when:
  - The connection to the MPI cannot be established, or has been lost before the ICN assignment was completed.

This happens regardless of which process is used to present the patient to the MPI for ICN assignment (i.e., Register a Patient, Load/Edit Patient Data, Electronic 10-10EZ Processing, and/or the Local/Missing ICN Resolution Background Job).

- The site edits an existing patient or adds a new patient using an option that doesn't directly interact with the MPI (e.g., VistA Lab or VA FileMan).
- All existing exceptions that were active in the CIRN HL7 EXCEPTION LOG file (#991.1) of the types listed below, were marked with a status of PROCESSED:
  - Required field(s) missing for patient sent to MPI
  - SSN Match Failed
  - Name Doesn't Match

These three exceptions listed are no longer generated.

As part of RG\*1\*43, the View Potential Match Patient [RG EXCEPTION POTENTIAL MATCH] option has been removed from the Message Exception Menu [RG EXCEPTION MENU] as it is obsolete.

The Display Only Query option allows the site to query the MPI to see what the MPI would return if the patient was presented for ICN assignment without actually making the request. The patient can be an existing patient or the user can choose to enter the name, date of birth and SSN (not required) and see what the MPI returns.

**NOTE:** More information about the "Potential Duplicate PATIENT records found by MPI" message is available via the installation of VistA Kernel Toolkit Patch XT\*7.3\*113.

# **Primary View Replaces Obsolete CMOR View**

As part of the MPI Changes Project, Iteration 4, the concept of a "CMOR facility" is being phased out and will be replaced by the Primary View when Patch MPI\*1\*40 is installed on the Austin MPI. VistA Patch MPIF\*1\*44 sets all VistA options related to "CMOR" out of order, rendering them obsolete. The OUT OF ORDER MESSAGE field for these options is marked as "Obsolete with Patch MPIF\*1\*44." Obsolete options will be removed from the Coordinating Master of Record (CMOR) Request [MPIF CMOR MGR] menu at a future date.

# Systems of Interest to the MPI—Treating Facilities and Non-VistA Systems

The term "systems of interest" refers to VA facilities that have seen patients and entered them as entries onto the MPI. This also refers to non-VistA systems that have a registered interest in a patient (e.g., Federal Health Information Exchange [FHIE], HomeTeleHealth, Person Service Identity Management [PSIM], Health Data Repository [HDR], etc).

A facility's relationship to a patient determines what information it receives and sends. MPI/PD VistA stores this information.

Any facility where a patient is identified by the same ICN (regardless of VISN) is placed on the Treating Facility List. The list may contain other systems of interest that are not VAMCs (e.g., FHIE and HDR).

**NOTE:** The Treating Facility List is utilized by several other VistA applications, including Interfacility Consults and Remote Data Views in CPRS.

# Chapter 3: Primary View—How are VistA Sites Affected by this Change to the MPI?

# What is the Primary View?

Patch MPI\*1\*40 constituted a change in the business process that updates the patient identity fields across VA facilities referred to as the Primary View of the MPI, overview as follows:

- Primary View is an update to the patient identity fields across VA facilities.
- Primary View creates a centralized view of the patient data, aka a Primary View.
- Primary View has the best data from any combination of sites for the patient.
- Synchronizing the patient identity fields becomes centralized under a new set of business rules on the MPI.
- Primary View is a transition from and *disassociated* with the Coordinating Master of Record (CMOR) view of the MPI.
- Primary View removes the burden placed on sites to process the Patient Data Review (PDR) entries.
- Primary View allows for:
  - VistA sites to continue to edit their own patient data.
  - Patient data is sent to a central system (i.e., the Master Patient Index) to determine validity and quality

This is an enterprise view of the most current data for a patient based on authority scoring and the latest data rules. Edits to patient identity traits (listed below) are evaluated based on the same. The highest score achieves the best quality of data updates to the Primary View.

- Name
- Social Security Number
- Date of Birth
- Gender
- Mother's maiden name
- Multiple birth indicator
- Place of birth, city and state
- SSN Verification Status
- Pseudo SSN Reason
- Alias

# **How Does the Primary View Work?**

Before Patch MPI\*1\*40, patient data reviews were done at the CMOR sites. All 128 VA facilities had responsibility to manage and maintain their set of patients. With the release of Patch MPI\*1\*40, patient updates will be controlled by centralized business rules and Primary View scoring on the Master Patient Index (MPI). HC IdM staff will have the ability to override the rejection process of any valid edits.

In the transition to Primary View, when a patient is new to the MPI or an existing patient is initialized under the latest business rule changes, the CMOR process for resolving Patient Data Reviews will no longer exist. Instead, edits will be processed against the centralized data rules and Primary View scoring on the MPI. If the data update is rejected, the editing site will receive a Primary View Reject Exception report. This takes the burden off CMOR sites to review other sites' edits for acceptance or rejection.

# **Business Rules for Data Validity and Integrity**

The Healthcare Identity Management (HC IdM) team has developed two spreadsheets that dictate business rules for the Primary View:

- "Business Processes That Update Person Identity"—Authority score
- "Primary View Data Rules"—Data rules

Patient identity fields in the Primary View of the MPI are evaluated and updated based on scoring and data rules. The Primary View score is evaluated based on criteria captured from patient encounters at VA facilities (e.g., active prescriptions, admission or registration in the last year, lab test, or radiology exam in the last year) that are sending the inbound update (i.e., data entered by users or sent from a system of interest) to the MPI. The score is calculated from data updates coming from the site. Data is weighed on a field-by-field basis against any differences on the MPI to determine if the score for the inbound edits is equal to or greater than the score for the existing Primary View. Next, the inbound edit is evaluated against Primary View data rules.

Edits to key patient identity fields accepted for the update to the Primary View are broadcasted out to all systems of interest for that patient that do not already have the updated data. Data that does not meet or exceed the current score and pass the data rules generate reject exceptions, which are sent back to the site that attempted the edit. As of Patch MPI\*1\*40, sites received a new exception type in their MPI/PD Exception Handling option and a new exception action named View PV Rej Detail (PVR). This exception shows them when their edit was rejected and why.

**NOTE:** For a list of the patient identity fields that make up the Primary View on the MPI, see the section titled "Appendix G: Primary View Identity Traits" in this documentation.

**NOTE:** For information on Primary View Reject exceptions, see the following topics:

- "MPI/PD Exception Handling: Primary View Reject Type and View PV Rej Detail (PVR) Action," and
- "Primary View Reject Exception Type and View PV Rej Detail (PVR) Exception Action"

located in the "Message Exception Mention" section in this documentation.

**NOTE:** The MPI VETERAN/CLIENT file (#985) comprises the Primary View, which is all the pertinent identity fields and general demographic fields and is resident on the Austin MPI.

# **MPI Fields Broadcast to Systems of Interest**

The following fields are auto-updated in the VistA PATIENT file (#2) and broadcast by the MPI to systems of interest:

- Name
- SSN
- DOB
- Gender
- Mother's Maiden Name
- Multiple Birth Indicator (Sent and updated to Primary View as of Patch RG\*1\*45. Added to the list of fields auto-updated [synchronized] in VistA as of Patch RG\*1\*47.)
- SSN Verification Status (Verified, Invalid Per SSA, and null) (Added to File #985 as of Patch MPI\*1\*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of DG\*5.3\*688 [EVC R21.)
- Pseudo SSN Reason (Added to File #985 as of Patch MPI\*1\*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of RG\*1\*47 and DG\*5.3\*653 [EVC R1].)
- Alias (As of Patch DG\*5.3\*756, the ALIAS [#1] multiple in the PATIENT (#2) file will be updated in VistA resulting from the edits made to that information on the MPI by the HC IdM team. The VistA data will be synchronized to match the MPI values. Additionally, when a facility revises their local ALIAS data, the information will be transmitted to the MPI, which in turn will update all treating facilities where the patient is known.)

NOTE: For a description of the recent patient identity fields auto-updated in the VistA PATIENT file (#2) and broadcast by the MPI to systems of interest, see the "Enhanced MPI-to-VistA Synchronization—Additional Patient Identity Fields" topic located in the "Message Exception Menu" section in this documentation.

Patch MPI\*1\*40 introduces the concept of Primary View, which utilizes central business rules and removes the manual review process (Patient Data Review) from the sites. This will allow for faster updates and the ability to have the best data from multiple locations. The site-to-HC IdM communication will happen when there is a need for an override of a valid edit that received a Primary View Reject exception to the centralized business rules. The HC IdM team is comprised of analysts who have considerable experience working with the MPI and patient data updates.

Site edits to patient identity fields must pass the Primary View data rules as well as meet or exceed the current authority score value for that field before updating the Primary View on the MPI. If local data fails because the authority score has not weighed in high enough, the edit is rejected. Sites will receive a new exception message for rejected edits on their MPI/PD Exception Handling option named Primary

View Reject. This exception will inform sites why edits failing the initial tests were not accepted for update to the MPI.

**NOTE:** The term "auto-update" refers to fields that are updated from a central database (i.e., the Master Patient Index).

# **Enhanced MPI-to-VistA Synchronization—Additional Patient Identity Fields**

# SSN Verification Status Synchronized to Systems of Interest

The SSN Verification Status will be populated on the MPI and broadcast to treating facilities and systems of interest. The field values VERIFIED and INVALID PER SSA are triggered as a result of an update from the ESR application and subsequent update to the Primary View.

The SSN Verification Status is an existing field on the MPI with the current values listed below. In order to bring these values in line with the Enrollment VistA Changes (EVC) requirements and Standard Data Services (SDS) tables as well as support the later migration of data into the Administrative Data Repository (ADR), a change is needed to the internal and external value on the MPI. The current values are listed below; however, only the values of Null, Verified and Invalid Per SSA are synchronized with the sites.

- Null
- New Record
- In-Process
- Invalid Per SSA
- Resend to SSA
- Verified

# SSN and Pseudo SSN Reason Synchronized to Systems of Interest

When a VistA instance or Enrollment System Redesign (ESR) updates the Pseudo SSN Reason, the MPI will update MPI FACILITY ASSOCIATION file (#985.5). If the VistA instance is the Primary View, that value will be updated in File #985 and broadcasted out to all sites.

**April** 1999

# Multiple Birth Indicator Synchronized to Systems of Interest

As of Patch RG\*1\*45, the MULTIPLE BIRTH INDICATOR field is sent and stored on the MPI; however, it is not synchronized to all of the "systems of interest" (i.e., Treating Facilities). As of Patch RG\*1\*47, the MULTIPLE BIRTH INDICATOR is included in the list of patient identity fields that are synchronized from the MPI out to all systems of interest.

If synchronization of the MULTIPLE BIRTH INDICATOR field fails, an exception is logged on the MPI. This functionality is in support of the Patient Safety Office's effort to reduce the number of local duplicate record merges on records that are related to patients with similar trait values to their siblings.

**NOTE:** The Duplicate Record Merge: Patient Merge software has already been modified to display the MULTIPLE BIRTH INDICATOR field value if present.

### The ALIAS Multiple Stored on MPI and Synchronized to VistA

In the Primary View of the MPI, the ALIAS multiple (#50) is stored in the MPI VETERAN/CLIENT file (#985) as an aggregated list from all the treating facilities associated with that ICN. In VistA, the ALIAS multiple (#1) is stored in the PATIENT file (#2). All edits made by Healthcare Identity Management (HC IdM) staff to the ALIAS multiple on the MPI via the Edit PV Alias Values [MPI DATA MGT EDIT PV ALIAS] option are updated in the Primary View on the MPI and synchronized out to all systems of interest (e.g., VistA treating facilities) for that patient. Site edits to the ALIAS multiple (#1) in the VistA PATIENT file (#2) are updated in VistA and sent to the MPI for updates to the Primary View. The updates are then synchronized back out to all other treating facilities (systems of interest) associated with that ICN.

# Process Sequence for Inbound Edits: How Does the Primary View Work?

In the process for updating the Primary View of the MPI, the first check is for potential catastrophic edits to patient identity, which is defined as an edit to two or more of the following identity traits:

- Name (First, Last)
- Date Of Birth
- Social Security Number (SSN)
- Gender

If the potential catastrophic edit affects two or more identity traits, an exception is generated that becomes a manual HC IdM catastrophic edit review process. HC IdM processes potential catastrophic edits as follows:

- Accept All
- Reject All
- Partial Accept

If there are no catastrophic edits:

- All fields in Primary View are compared to the inbound data sent for that correlation.
- If there are differences, a series of computations begin to "score" the data to determine if it meets the criteria for acceptance. The Primary View score is based on data captured from a patient encounter with a Veterans Affairs facility (e.g., active prescriptions, admission or registration in the last year, lab test, or radiology exam in the last year).
- The score is then calculated from the data update coming from the site.
- Each field is then evaluated against any fields that are different in the current Primary View to see if the score is equal to or greater than the existing Primary View field's score and that the data update meets the business rules for data validity and integrity.
- Any of the fields, all of the fields, or none of the fields may be updated based upon the scoring and the business rules.
- NOTE: The MPI FACILITY ASSOCIATION file (#985.5) contains the sites' last update. This correlation is a duplicate of the same data in the PATIENT file (#2) at the sites.

# MPI/PD Exception Handling: Primary View Reject Type and View PV Rej Detail (PVR) Action

When patient identity fields are edited at VA facilities and sent to the MPI, those edits *must* meet or exceed the existing authority score and pass the Primary View data rules on a field-by-field basis. If an edit fails to pass both of these tests, the edit to that patient identity field is rejected.

The transition from the Coordinating Master of Record (CMOR) "view" to the Primary View introduces the following new exception type and exception action to the MPI/PD Exception Handling option [RG EXCEPTION HANDLING]:

- **Primary View Reject exception type•** Rejected edits to the Primary View on the MPI generate this exception, which is sent back to the site that attempted the edit. These exception types will be listed at the top of their exceptions in their Exception Handler.
- View PV Rej Detail (PVR) exception action• Site personnel can use the View PV Rej Detail (PVR) action to view more details about rejected data from the MPI in Austin, allowing them see why their edit(s) was rejected.
- NOTE: For more information on the Primary View Reject exception type and exception action on the MPI/PD Exception Handling option, see the "Primary View Reject Exception Type and View PV Rej Detail (PVR) Exception Action" topic located in the "Message Exception Menu" section in this documentation.

# **HC IdM View/Edit Authority Values for Business Rules Criterion**

Healthcare Identity Management (HC IdM) staff can view or edit the current authority values for the Primary View business rules criterion. These authority values weigh and score inbound edits to the patient entries on the MPI based on patient activity at the site.

Primary View—How are VistA Sites Affected by this Change to the MPI?

# Chapter 4: Software Management

## **Name and Number Spaces**

The MPI/PD software is made up of two applications:

- RG Namespace—File range is 990–995 and 997–999.99.
- MPIF Namespace—File range is 994.

## **Software Requirements**

The following software (fully patched) *must* be installed at the site:

Application	Version # and Patches	
CIRN	Version 0.5 fully patched	
Health Level 7 (HL7) VistA	Version 1.6 fully patched NOTE: Place HL*1.6*39 in Production account only.	
Kernel	Version 8 fully patched	
Kernel Toolkit	Version 7.3 fully patched	
MailMan	Version 7.1 fully patched	
Master Patient Index/Patient Demographics (MPI/PD)	RG Version 1.0 fully patched MPIF Version 1.0 fully patched	
Pharmacy	If running Computerized Patient Record System (CPRS), fully patched version of Outpatient Pharmacy V. 7.0, and Inpatient V. 5.0.	
PIMS	Version 5.3 fully patched	
Registration	Version 5.3 fully patched	
VA FileMan	Version 22 fully patched	

Table 4-1: Applications that need to be installed and fully patched for MPI/PD VistA

CAUTION: DO NOT INSTALL HL\*1.6\*39 IN ANY TEST ACCOUNT! If you install this patch in your test account, you will link your test account to all the other production accounts. Since there are similarities (e.g., patient names/data) in test and production, it would not be good for data from the test account to be transmitted to the production account at another site.

CAUTION: RG\* and MPIF\* patches should NOT be installed on legacy systems to avoid issues with the legacy systems ending up as Treating Facilities.

# **Legal Requirements**

This software does not impose any additional legal requirements on the user. All users are reminded that many of the reports generated by this software contain confidential patient information and *must* be treated accordingly.

## **HL7 Application Parameters File**

Check that the correct Station Number is entered in the FACILITY NAME field (#3) of the HL7 APPLICATION PARAMETER file (#771), Figure 4-2. Local modifications to your INSTITUTION file (#4) may conflict with MPI/PD VistA installation setup.

HL7 APPLICATION NAME	PARAMETER LIST MAR 15,2000 10:45 PAGE 1 FACILITY NAME

Figure 4-2: HL7 Application Parameter List

### **Bulletin**

The RG CIRN DEMOGRAPHIC ISSUES bulletin controls the sending of the following patient related bulletin, Table 4-4.

Patient Related Bulletin	Cause	Action to take
REMOTE SENSITIVITY INDICATED	Patient is marked as sensitive at the sending site but not at receiving site.	No action: message is informational

Table 4-1: RG CIRN DEMOGRAPHIC ISSUES bulletin: REMOTE SENSITIVITY INDICATED

## **Exception Handling Messages**

The MPI/PD Exception Handling option generates messages to alert site personnel of problems that occur in generating or processing HL7 messages. For examples of messages that may be received during the implementation phase and how to resolve the problems, see the Master Patient Index/Patient Demographics (MPI/PD) VistA Exception Handling manual located at the MPI/PD Web site at the address listed below:

http://www.va.gov/vdl/section.asp?secid=2

This document gives Master Patient Index/Patient Demographics (MPI/PD) sites information and assistance in dealing with exception messages.

## **MPI/PD Mail Groups**

Mail Group	Suggested Coordinator	Suggested Members	Description
HL7 SITE POC (ON FORUM)	Personnel who monitor MPI/PD HL7 problems.	Personnel who monitor MPI/PD HL7 problems.	This mail group is for personnel who will address HL7 issues.
MPIF EXCEPTIONS	Messages are sent to the MPI Exception Handler on the Austin MPI. There shouldn't be any local members in this mail group.	Messages are sent to the remote mail group G.CIRN EXCEPTION MGT@FORU M.VA.GOV, which is the Exception Handler on the MPI in Austin.	MPI Exception Messages to be addressed are sent to this mail group. These messages are all technical in nature, involving problems with HL7 messages or ICN not found. There normally isn't anything the site can do about these, so these messages are sent to a remote mail group. This mail group is used by MPI site point of contacts to send the Healthcare Identity Management (HC IdM) team potential duplicates, questions, issues, etc. This is a local VistA mail group that is then forwarded to the CIRN EXCEPTION MGT mail group on FORUM. If necessary, the remote mail group members will contact the site's personnel for assistance.
RG CIRN DEMOGRAPHIC ISSUES	Health Administration Service (HAS)/MPI/P D Coordinator	Personnel that deal with patient data.	This mail group should contain person(s) responsible for ensuring the integrity of the Patient Information Management Systems (PIMS) data. The members of this group will be notified upon login that there are patients awaiting review.  NOTE: Upon logon to the system, members of the RG CIRN DEMOGRAPHIC ISSUES Mail Group now only see the one notification alerting users if there are Primary View Reject exceptions that need to be reviewed (Potential Matches Returned are obsolete).

Mail Group	Suggested Coordinator	Suggested Members	Description
RG CIRN HL7 PROBLEMS	Personnel who monitor MPI/PD HL7 problems.	Personnel who monitor MPI/PD HL7 problems.	This mail group receives notification of problems that CIRN (MPI/PD) has when interacting with the VistA HL7 package.

Table 4-3: Mail Groups exported in the MPI/PD VistA package

Software Management

# Chapter 5: MPI/PD Menus and Options

This section describes the menus and options comprising the MPI/PD VistA. These options should be made accessible to authorized IRM, Program Application Specialists (PAS), site MPI POCs, and/or Coordinators, etc., and VA facility personnel who will be involved in working with the MPI/PD VistA.

## MPI/PD Master Menu

The MPI/PD Master Menu is the primary menu that contains all Master Patient Index/ Patient Demographics (MPI/PD) menus and sub-menus.

**NOTE:** Sub-menus should be assigned to users as appropriate and are described in the MPI/PD Implementation Guide.

```
Select OPTION NAME: MPI/PD Master Menu <Enter> RGMGR MPI/PD Master Menu
         MPI/PD Patient Admin Coordinator Menu ...
  IRM
       MPI/PD IRM Menu ...
Select MPI/PD Master Menu Option:
```

Figure 5-1: MPI/PD Master Menu

The following menus comprise the MPI/PD VistA (listed in the order that they appear on the MPI/PD Master Menu):

- MPI/PD Patient Admin Coordinator Menu
- MPI/PD IRM Menu

Each menu and its associated options are described in detail in the topics that follow in this chapter.

#### MPI/PD Patient Admin Coordinator Menu

The MPI/PD Patient Admin Coordinator Menu [RG ADMIN COORD MENU] options allow users to monitor and update patient data. Figure 5-2 shows the menus and options that are located on this menu.

```
Select MPI/PD Master Menu Option: cord <Enter> MPI/PD Patient Admin Coordinator Menu

LOG Patient Audit Log Reports ...
MSG Message Exception Menu ...
RPT Management Reports ...
POC Add/Edit Point of Contact

Select MPI/PD Patient Admin Coordinator Menu Option:
```

Figure 5-2: MPI/PD Patient Admin Coordinator Menu

- NOTE: For more information on the MPI/PD Patient Admin Coordinator Menu, please refer to the "MPI/PD Patient Admin Coordinator Menu" topic in the "MPI/PD Master Menu" section of the documentation.
- **NOTE:** The active options shown on this menu are described in the topics that follow in this chapter.

#### MPI/PD IRM Menu

The MPI/PD IRM Menu provides Information Resource Management (IRM) personnel with the options needed to maintain the Master Patient Index/Patient Demographics (MPI/PD) software. Figure 5-3 shows the options that are located on this menu.

```
Select MPI/PD Master Menu Option: IRM <Enter> MPI/PD IRM Menu

Link and Process Status Display
Unresolved Exception Summary

Select MPI/PD IRM Menu Option:
```

Figure 5-3: MPI/PD IRM Menu

NOTE: For more information on the MPI/PD IRM Menu, please refer to the "MPI/PD IRM Menu" topic in the "MPI/PD Master Menu" section of the documentation.

### MPI/PD Patient Admin Coordinator Menu

The MPI/PD Patient Admin Coordinator Menu [RG ADMIN COORD MENU] options allow the monitoring of patient data activities.

```
Select MPI/PD Master Menu Option: cord <Enter> MPI/PD Patient Admin Coordinator Menu

LOG Patient Audit Log Reports ...
MSG Message Exception Menu ...
RPT Management Reports ...
POC Add/Edit Point of Contact

Select MPI/PD Patient Admin Coordinator Menu Option:
```

Figure 5-4: MPI/PD Patient Admin Coordinator Menu

# Patient Audit Log Reports... [RG TRAN/AUD AUD REP]

The Patient Audit Log Reports menu contains two options for reviewing information stored in the AUDIT file (#1.1) for fields being audited in the PATIENT file (#2). Options allow the user to view:

- All audited fields
- Selected fields for a date range
- All audited data on a single patient

```
Select MPI/PD Master Menu Option: cord <Enter> MPI/PD Patient Admin Coordinator Menu

LOG Patient Audit Log Reports ...
MSG Message Exception Menu ...
RPT Management Reports ...
POC Add/Edit Point of Contact

Select MPI/PD Patient Admin Coordinator Menu Option: LOG <Enter> Patient Audit Log Reports

Patient Audit File Print
Single Patient Audit File Print
Select Patient Audit Log Reports Option:
```

Figure 5-5: Patient Audit Log Reports Menu

#### Patient Audit File Print

#### [RGMT AUDIT PRINT]

This option prints a customized report of information stored in the AUDIT file (#1.1) for fields being audited in the PATIENT file (#2). You can:

- View all audited fields
- View selected fields for a specified date range
- Print only edits that were done by a specific user

If selected fields are viewed, you can choose to see data for all or selected patients. If you only enter one name and there is no audit data on the selected date range, you are told this on the printout. If multiple names are entered, it only prints those that have had an audit in the selected date range. The other names are not displayed on the report (i.e., there is no message indicating there was no audit data).

```

          Remote Patient Data Query Menu ...
          Display Only Query
          Primary View Display from MPI
Select Message Exception Menu Option:
```

Figure 5-9: MPI/PD Exception Handling menu

#### **MPI/PD Exception Handling**

#### [RG EXCEPTION HANDLING]

The MPI/PD Exception Handling option is located on the Message Exception Menu. It provides utilities for processing MPI/PD Exceptions in the CIRN HL7 EXCEPTION LOG file (#991.1). This List Manager based option displays exceptions allowing users to choose an exception case for review and resolution.

#### NOTE: CIRN HL7 EXCEPTION LOG file (#991.1) Captures VA facility Interaction with MPI/PD Exception Handling Option

VA facility personnel use the MPI/PD Exception Handling [RG EXCEPTION HANDLING] option to review and process exceptions (duplicate entries for a single patient, validation of edits to patient identity fields, etc.) received from MPI. As of Patch RG\*1\*48v, the CIRN HL7 EXCEPTION LOG file (#991.1) has been modified to record VA facility personnel who use the MPI/PD Exception Handling option to resolved exceptions and the date/time the resolution occurred. Patch RG\*1\*48 adds the following new fields to File #991.1:

- DATE/TIME PROCESSED field (#7)
- WHO MARKED PROCESSED field (#8)

This data is being captured and Healthcare Identity Management (HC IdM) staff will have the capability to view this information.

#### **Changes to the MPI Purge Process**

A change has been made in the MPI/PD EXCEPTION HANDLING [RG EXCEPTION HANDLING] option. Upon selecting the MPI/PD Exception Handling option, instead of being prompted to run the exception purge, you are now notified when the last purge took place. The purge process runs automatically if it has not run within the past two hours; however, the MPI/PD EXCEPTION PURGE [RG EXCEPTION PURGE] option should be scheduled to run once an hour via Taskman. It can take a few minutes to run, but once the job is finished, you can go back to the Message Exception Menu and choose MPI/PD Exception Handling to view the results of the purge process.

If for any reason the task becomes unscheduled, the time that the purge process last ran will be displayed upon entry into the Exception Handler and this message will be displayed:

Please notify IRM if the MPI/PD EXCEPTION PURGE [RG EXCEPTION PURGE] job needs to be rescheduled.

**NOTE:** ATTENTION IRM: After patch RG\*1\*48 has been successfully installed, the MPI/PD Exception Purge [RG EXCEPTION PURGE] option should be scheduled to run once per hour. To do this, use the Schedule/Unschedule Options [XUTM SCHEDULE] option on the Taskman Management [XUTM MGR] menu. In the QUEUED TO RUN AT WHAT TIME field, enter a time that is a few minutes into the future (as soon as possible.) In the RESCHEDULING FREQUENCY field, enter "1H" (1 hour).

```
Select Message Exception Menu Option: MPI/PD Exception Handling

The MPI/PD Exception Purge process last ran May 29, 2007@18:43:35.

The MPI/PD Exception Purge process will now run.
Please come back to this option in five minutes.

Please contact IRM to verify that the MPI/PD EXCEPTION PURGE
[RG EXCEPTION PURGE] option is scheduled to run via TaskMan with a frequency of once an hour.
```

Figure 5-10: MPI/PD Exception Purge process

The purge process eliminates duplicate exceptions for the same patient/exception type, keeping only the most recent occurrence.

The MPI/PD EXCEPTION PURGE [RG EXCEPTION PURGE] option should be scheduled to run once an hour via Task Manager. Contact Information Resource Management (IRM) to verify that this job is scheduled and running.

#### **Processing MPI/PD Exceptions**

Primary View Reject exceptions will be listed at the top of the MPI/PD Exception Handling list unless a different sort is selected. There are several actions to sort by, they are:

- SD• Sort Exceptions by Date
- VT• View Selected Exception Type
- SN• Sort by Patient Name
- SE• Selection Exception
- ST• Sort by Exception Type

**April** 1999

- **NOTE:** The Potential Matches Returned exception in the VistA Exception Handler was made obsolete via VistA Patch MPIF\*1\*52 in that the logging of Potential Matches Returned exceptions was removed from the VistA HL7 message processor routines.
- **NOTE:** As of VistA Patches MPIF\*1\*43 and RG\*1\*43, in order to support the effort to obtain Integration Control Numbers (ICNs) for all patients in the Health Eligibility Center (HEC) database, when and how a patient gets an ICN changed. If an exact match is not found on the Master Patient Index (MPI), then that patient is added to the MPI. The following conditions constitute local ICNs:
  - When the site edits an existing patient or adds a new patient using an option that doesn't directly interact with the MPI (e.g., VistA Lab or VA FileMan).
  - When communication can't be established or is lost with the MPI before the ICN assignment process has completed, a local ICN is assigned

As a result of these changes, specific exceptions are no longer generated. These include the following three exception types:

- Required field(s) missing for patient sent to MPI
- SSN Match Failed
- Name Doesn't Match

As of VistA Patch RG\*1\*43, all existing active exceptions in the CIRN HL7 EXCEPTION LOG file (#991.1) that have any of the above three exception types and the Potential Matches Returned exception type were marked with a status of PROCESSED.

Existing patient records that had these exceptions at the time of in installation of RG\*1\*43 were sent to the MPI again, and under the new business rules, were assigned ICNs. At this point, if appropriate, these records received a new Potential Matches Returned exception for site personnel to review.

### Primary View Reject Exception Type and View PV Rej Detail (PVR) Exception Action

When patient identity fields are edited at VA facilities and sent to the MPI, those edits *must* meet or exceed the existing authority score and pass the Primary View data rules on a field-by-field basis. If an edit fails to pass both of these tests, the edit to that patient identity field is rejected.

The transition from the Coordinating Master of Record (CMOR) "view" to the Primary View introduces the following new exception type and exception action to the MPI/PD Exception Handling option [RG EXCEPTION HANDLING]:

- **Primary View Reject exception type** Rejected edits to the Primary View on the MPI generate this exception, which is sent back to the site that attempted the edit.
- View PV Rej Detail (PVR) exception action• Site personnel can use the View PV Rej Detail (PVR) action to view more details about rejected data from the MPI in Austin, allowing them to see why their edit(s) was rejected.

After review of the Primary View reject, sites can select the UPD action to change the exception status from NOT PROCESSED to PROCESSED. This clears the reject exception off the MPI/PD Exception Handling option.

If a site determines that the rejected data is a valid edit, the only way to get that data updated on the MPI is to contact the Healthcare Identity Management (HC IdM) team and have them make the edit. HC IdM has the ability to overwrite Primary View data.

**NOTE:** For Healthcare Identity Management (HC IdM) contact information, see the "Contact HC IdM Team if Your Site Determines Rejected Data is Valid" topic in the "Message Exception Menu" section of this documentation.

Upon selection of a reject exception, a remote query is automatically sent to the MPI that will bring back a display of the details allowing sites to see why their edit was rejected.

The following screen captures and descriptive text show the series of events that sites will likely take when reviewing and processing Primary View Reject exceptions.

```

Figure 5-15: Select exception on the Exception Handling option

To begin processing Primary View Reject exceptions, select the new action View PV Rej Detail (PVR) at the "Select Action:" prompt. Figure 5-16 shows an example of a Primary View Reject exception generated on Jan 10, 2007, with a status of NOT PROCESSED. An edit to one of the patient identity fields caused the error because the authority score was not high enough or it failed a data rule.

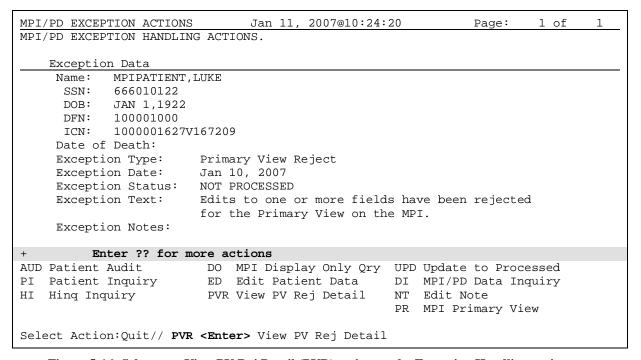

Figure 5-16: Select new View PV Rej Detail (PVR) action on the Exception Handling option

#### Selecting the View PV Rej Detail Action Automatically Sends a Remote Query to the MPI

Selecting the PVR action automatically initiates the following process:

- Sends a request to the Master Patient Index for information on the rejected edit to the Primary View for the selected patient at your facility, beginning with the date of the Primary View Reject exception.
- Reports the various statuses of the query in the interim.
- Displays a screen showing the Primary View Reject Details Report for that patient, which is also available to the HC IdM staff.

This process can happen in any of the next four scenarios:

1. Figure 5-17 shows the output if a query has never been sent to the MPI for the Primary View Reject information on this patient (i.e., this is the first time a request is being sent to the MPI).

```
Select Action:Quit// PVR <Enter> View PV Rej Detail
  Sending a Remote Query to the Master Patient Index.
  This will take some time; please be patient.
```

Figure 5-17: Sending a Remote Query for this ICN/Exception Date to the Master Patient Index

If you have never sent a query to the MPI for this patient before, when the query returns from the MPI, you will get your data back displayed in a new screen in the form of a Primary View Reject Report, Figure 5-18.

```
Jan 11, 2007@10:24:20
REMOTE PRIMARY VIEW REJECT

Local Edit Value: JONESVILLE
                                                             0
 If you believe this edit is valid, contact the HC IdM Team for assistance via
 the G.MPIF EXCEPTIONS mailgroup (VistA) or the VHA OI IA MPI DQ TEAM mailgroup
 (Outlook). Transmission of patient sensitive data requires PKI encryption.
Select Action: Next Screen// ^
```

Figure 5-18: MPI Primary View Reject report sent back from the query to the MPI

The Healthcare Identity Management (HC IdM) team views this same information in a form called the Primary View Reject Report.

2. Figure 5-19 shows the output if a previous query had already been sent on a prior day to the MPI for this patient with the same exception date.

```
Select Action:Quit// PVR <Enter> View PV Rej Detail
A query was last sent for this ICN/Exception Date on Jan 11, 2007@11:19:08
Previous Query data may be obsolete.
Sending a Remote Query to the Master Patient Index.
This will take some time; please be patient.
Query data has returned from the MPI and is available for review.
```

Figure 5-19: Resending Remote Query for ICN/Exception Date to the Master Patient Index

- NOTE: A new query is sent if the reject exception you are reviewing was not generated on the current date (today's date). This is because there can always be the possibility previous query data may be obsolete.
- 3. Figure 5-20 shows the output if the previous query had been sent to the MPI for this patient with the same exception date on the same day (today's date). In other words, you've reviewed the exception more than once in one day. This is also the display you would see if you sent the query earlier in the day, but due to messaging traffic, etc., the query data was not able to return from the MPI quickly. In the meantime, the query data has returned, and is now available for review.

```
Select Action:Quit// PVR <Enter> View PV Rej Detail
A query was last sent for this ICN/Exception Date on Jan 11, 2007@11:25:18.
Do you wish to review that existing query data now? YES// <Enter>
```

Figure 5-20: Query not sent again for this ICN/Exception Date because you are viewing it on the same day

Pressing the **Enter**> key or entering "Yes" at the "Do you wish to review that existing query data now? YES// " prompt in Figure 5-20 displays the existing Primary View Reject report.

4. As a continuation from scenario #3, if for any reason you want to send a new query, simply reject the default answer and respond with "No." Figure 5-21 shows what you will see:

```
Select Action:Quit// PVR <Enter> View PV Rej Detail
A query was last sent for this ICN/Exception Date on Jan 11, 2007@00:09:14
Do you wish to review that existing query data now? YES// n <Enter> NO
Sending a Remote Query to the Master Patient Index.
This will take some time; please be patient.
Query data has returned from the MPI and is available for review.
```

Figure 5-21: Requesting a new remote query to the MPI

#### Queries to MPI Not Returned After 30 Seconds Displays "Please try again later"

If after you've selected the PVR action the system is busy, it might take some time for the query request to return the data from the MPI. The software will try for up to 30 seconds to get a response. If data is not returned within that timeframe, Figure 5-22 shows the message you will see. The query can fail due to network or connectivity issues, just check back at a later time to send another query.

```
Select Action:Quit// PVR <Enter> View PV Rej Detail
Your query request has NOT returned data from the MPI after trying for
30 seconds. This could be due to network issues. Please try again later.
```

Figure 5-22: Queries to MPI not returned after 30 Seconds displays "Please try again later"

#### Contact HC IdM Team if Your Site Determines Rejected Data is Valid

It is recommended that sites review their rejected data to determine why the reject occurred. This is intended to help determine if local education needs to take place to prevent future data rejects.

VA facilities need to contact the Healthcare Identity Management (HC IdM) team in circumstances where valid edits are rejected on the MPI, because they did not pass the initial validation tests. HC IdM has the ability to overwrite Primary View data on the MPI. Once HC IdM has overwritten a piece of data, the authoritative score for that data jumps to 1000. This is the maximum score that a field can get. Any future edits to this field will never surpass that score and will stop this edit from being rejected again. This functionality is intended to stabilize valid and verified field values, which are agreed upon between HC IdM and the site. If your site determines the edit in question is valid, contact HC IdM team for assistance via the following e-mail groups:

- MPIF EXCEPTIONS mail group (local VistA)
- CIRN EXCEPTION MGT mail group (FORUM)
- VHA OI IA MPI DQ Team distribution group on Outlook (PKI encryption required)

CAUTION: Transmission of patient sensitive data requires Public Key Infrastructure (PKI) encryption.

#### Marking Reject Exceptions Complete and Clearing them from the Exception Handler

When this information has been reviewed and is no longer needed, return to the MPI/PD EXCEPTION ACTIONS screen. Mark the exception as finished by using the "UPD Update to Processed" action.

```
MPI/PD EXCEPTION ACTIONS
                            Jan 11, 2007@10:24:20
                                                            Page:
                                                                      1 of

Are you sure you want to change the status? YES// YES <Enter>
This option updates the exception status to PROCESSED.
After it is processed it will not be listed in the summary.
Are you sure you want to change the status? YES// <Enter>
```

Figure 5-23: Select Update to Processed (UPD) action—Remove Primary View Reject exception

If your site agrees with the data rejection, the exception is no longer needed. Return to the MPI/PD EXCEPTION ACTIONS screen, Figure 5-23, and mark the exception status from NOT PROCESSED to PROCESSED, Figure 5-24, by using the "UPD Update to Processed" action. This will remove the exception off the Exception Handling option.

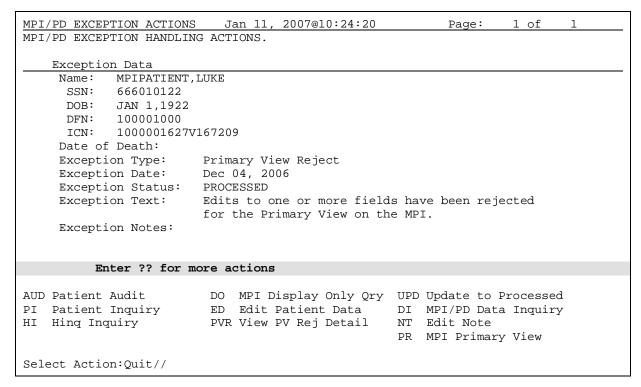

Figure 5-24: Primary View Reject Exception Status updated to PROCESSED—Exception removed

- NOTE: VA facilities need to contact the Healthcare Identity Management (HC IdM) team in circumstances where valid edits are rejected on the MPI, because they did not pass the initial validation tests. HC IdM has the ability to overwrite Primary View data on the MPI. Once HC IdM has overwritten a piece of data, the authoritative score for that data jumps to 1000. This is the maximum score that a field can get. Any future edits to this field will never surpass that score and will stop this edit from being rejected again. This functionality is intended to stabilize valid and verified field values, which are agreed upon between HC IdM and the site.
- NOTE: The Remote Primary View Reject action shows one reject per screen.
- NOTE: The HC IdM Team has access to the same information in the Primary View Reject Report, as is shown in the Primary View Reject exception found on the MPI/PD Exception Handling option at the VA facilities. This means that HC IdM can access this same information when requested.

#### Primary View Authority Score Criteria and Data Rules for Evaluating Data Quality

When patient identity fields are edited at VA facilities and sent to the MPI, they *must* meet or exceed the existing authority score and pass the Primary View business rules on a field-by-field basis. The following

are links to two spreadsheets developed by the Healthcare Identity Management (HC IdM) staff for the criteria for computing the Primary View authority scores and the Primary View data rules:

- Scoring of Primary View data is based on criteria captured from patient encounters with VA facilities. These are authority score values, the criteria of which are weighted in such a way that the site's edits to the MPI are measured and calculated on a field-by-field basis. The resulting value needs to meet or exceed the current authority score to have enough weight to change the Primary View. If not, that edit will be rejected and a Primary View Reject exception will be sent to the sending site. If the site making the edit has activity with the patient, validated based on authority score calculations and criterion matches proving that the patient is being seen at that site, their score will be high enough to make an edit to that identity trait. These events indicate where the patient is actively seen. This is considered the authoritative site.
- The Primary View Data Rules regulate entering data in specific formats for which users *cannot* violate. The goal of which is to improve the quality of data. These conditions that are different for each identity trait have to be met before a patient identity field can be edited.
  - **NOTE:** For more information, see the Primary View Data Rules document at the following address:

http://vista.med.va.gov/mpi/HC IdM\_Primary\_View\_Data\_Rules.asp

- **NOTE:** The HC IdM team is also an authoritative source for Primary View data and can override any data on the MPI.
- NOTE: Primary View Reject exceptions are for review purposes, only. VA facility personnel can review these exceptions and update the Exception Status to PROCESSED, which clears them off the MPI/PD Exception Handling option.

#### **Example Scenario: Site Corrects First Name Which Generates Reject Exception**

"George" is the name of a patient who has been actively seen at a VA facility for a long time. At the time of initial data entry, hospital personnel at George's VA facility transposed two characters in his first name (i.e., "Goerge"). George has had a lot of activity at this site (e.g., he was admitted as a patient at one time, he is currently assigned to a Primary Care Team, he has active prescriptions, and has a future appointment date for care, etc.); hence, he has a high authority score for the FIRST NAME patient identity field.

Later, George made a visit to a different VA facility for care. Hospital personnel at this facility notice the error in his first name and attempt to fix it; but in doing so, the VA facility generated a Primary View Reject exception because the MPI rejected the edit.

Why did this happen? It is because this is his first visit to this other facility (e.g., he has never been admitted as a patient; he is not currently assigned to a Primary Care Team at this new facility; he has no active prescriptions [his prescriptions have not been transferred over from his other VA facility yet], etc.). The authority score that George established for his first visit to this second site did not meet or exceed the current authority score for his FIRST NAME patient identity field. Hence, the edit did not pass the validation tests, which resulted in a reject exception.

#### VA Facilities Can View the Primary View Data on the MPI

VA facilities have the ability to remotely view Primary View patient identity fields on the Master Patient Index (MPI). The report generated by this option displays the current activity scores for individual patient identity fields (i.e., Primary View of the MPI) and the primary view data fields. VA facilities send a remote query to the MPI to view the MPI primary view information. The same capability to examine this data is available in two locations:

- An action named MPI Primary View (PR), which is located on the MPI/PD Exception Handling [RG EXCEPTION HANDLING] option.
- An option named Primary View Display from MPI [RG PRIMARY VIEW FROM MPI], located on the Message Exception Menu [RG EXCEPTION MENU].

There is a difference between the MPI Primary View action on the MPI/PD Exception Handler and the Primary View Display from MPI option. The Primary View Display from MPI option offers VA facilities the ability to send remote queries to the MPI to view patient identity data regardless if there is an exception logged for the patient.

#### MPI/PD Exception Handling Action: MPI Primary View

The following are instructions for using the MPI Primary View action on the MPI/PD Exception Handling option to remotely view Primary View patient identity fields on the Master Patient Index (MPI). The functionality is the same for the Primary View Display from MPI [RG PRIMARY VIEW FROM MPI].

On the MPI/PD Exception Handling option, choose a patient on the first screen(s) of the Exception Handler using the Select Exception action. Next, select the new action MPI Primary View (PR), Figure 5-26.

```

                                                                                              PR MPI Primary View
Select Action:Quit// PR (Enter) MPI Primary View
```

Figure 5-25: MPI/PD Exception Handling Action• MPI Primary View

Based on the query status of the patient, there are three possible paths that this functionality can take:

1. If a query has *never* been sent to the MPI for this patient, a remote query is sent to the MPI Patient Data Inquiry option for the first time, Figure 5-26.

```
Sending a Remote Query to the Master Patient Index.
This will take some time; please be patient.
```

Figure 5-26: Query has never been sent to the MPI PDAT

2. If a previous query was sent to the MPI for this patient, the following message is shown indicating a query was sent to the MPI and on what date, Figure 5-27. Selecting the default answer of YES displays the MPI Patient Data Inquiry (PDAT) information on the next page/screen.

```
A query was last sent for this ICN on <date>.
Do you wish to review that existing query data now? YES// <Enter>
```

Figure 5-27: Query has already been sent to the MPI PDAT. Display existing query data

3. If a previous query was sent to the MPI for this patient, the following message is shown indicating a query was sent to the MPI and on what date, Figure 5-28; however, in this case the user selected not to review the previous query.

```
A query was last sent for this ICN on <date>.
Do you wish to review that existing query data now? YES// NO
```

Figure 5-28: Query has already been sent to the MPI PDAT. Do not display existing query data

If for any reason you want to send a new query, simply reject the default answer and respond *NO*. Figure 5-29.

```
Sending a Remote Query to the Master Patient Index.
This will take some time; please be patient.
```

Figure 5-29: Resend query to the MPI PDAT for current patient data

It is possible that it may take some time for the query request to return the data from the MPI. The software will try for up to 30 seconds to get a response. If data is not returned within that timeframe, you might see a message instructing you to check back later to send another query, Figure 5-30.

```
Your query request has NOT returned data from the MPI after trying for
30 seconds. This could be due to network issues. Please try again later.
```

Figure 5-30: Query data has NOT returned from the MPI. Please check back later.

When the query data has returned from the MPI and is available for review, a new page/screen displays the MPI Patient Data Inquiry (PDAT) report.

**NOTE:** For information on VA facilities' the ability to send remote queries to the MPI to view patient identity data regardless if there is an exception logged for the patient, see the documentation for the option "Primary View Display from MPI [RG PRIMARY VIEW FROM MPI]" location in this manual.

#### Patch RG\*1\*43 Retired the Following Exception Types:

- Potential Match
- Missing Required Fields

• SSN Mismatch or Name Mismatch

Patch RG\*1\*43 also resulted in all local ICNs being sent to the MPI for ICN assignment the next time the Local/Missing ICN Resolution Background Job [MPIF LOC/MIS ICN RES] job ran. Any new potential match exceptions logged were a result of the patient being presented to the MPI under the new enumeration process.

Patients that had these pending exceptions were sent up to the MPI for ICN assignment under the new business process and were assigned an ICN (either new one or matched to an existing patient on the MPI). If a potential match was found, a potential match exception was also logged for review by the local VistA staff.

**NOTE:** For more detailed information on exception messages, their resolution, and the MPI/PD Exception Handling option [RG EXCEPTION HANDLING], see the Master Patient Index/Patient Demographics (MPI/PD) VistA Exception Handling manual at the following web site:

http://www.va.gov/vdl/Infrastructure.asp?appID=16

This document gives Master Patient Index/Patient Demographics (MPI/PD) sites information and assistance in dealing with exception messages.

#### **Exceptions Deleted for Patient Records Following a Duplicate Record Merge**

When records were merged using the Kernel Toolkit Duplicate Resolution System [XDR MAIN MENU], there have been cases where exceptions existed for some of these records. When a facility attempted to resolve these exceptions using the MPI/PD Exception Handling option [RG EXCEPTION HANDLING], these exceptions were sent to the MPI.

MPI/PD Patch RG\*1\*29 corrects this pattern by deleting any existing exceptions on file for a patient record being merged into another record. In addition, users will no longer be restricted from merging records when both records in a duplicate pair have a national ICN. A call to the API A40^MPIFA40 was added to send HL7 messages to the MPI to remove the "FROM" record and send messages to the "FROM" record's Treating Facilities to change ICNs to the "TO" record ICN. These changes address NOIS PUG-0902-51018.

### Patient MPI/PD Data Inquiry

#### [RG EXCEPTION TF INQUIRY]

This report prints MPI/PD Data for a selected patient. Information displayed includes the following data:

- Integration Control Number (ICN)
- Patient Identifying Data
- Treating Facility list

The information is pulled from the following VistA files:

- PATIENT file (#2)
- TREATING FACILITY LIST files (#391.91)

Patient lookup can be done by Patient Name/SSN or by ICN.

**NOTE:** Enhancements were added to this option in Patch DG\*5.3\*505 to display the MULTIPLE BIRTH INDICATOR (#994), POW STATUS INDICATED? (#.525), RACE INFORMATION (#2) sub field 2.02, and ETHNICITY INFORMATION (#6) sub field 2.06 fields. These fields have been added in support of the MPI Austin; the Healthcare Identity Management team needs facility information to improve data quality and to resolve differences on the MPI.

**NOTE:** The following enhancements were added to this option as of Patch DG\*5.3\*707:

- Display SSN Verification and Pseudo SSN Reason.
- Remove the call to calculate CMOR score and remove the display of CMOR Score and Subscription Control Number.
- Modify format of display.

```

Figure 5-40: Display Only Query when Patient exists in Patient File

If the user answers "No" at the "Is Patient in the PATIENT file?" prompt then the patient's name and date of birth must be entered. The patient's Social Security Number (SSN) is an optional field; however, not supplying the SSN could affect the results of the search.

Several new fields are being stored on the MPI as a result of the MPI Changes project. Therefore, the ALIAS (multiple), MULTIPLE BIRTH INDICATOR, and POW STATUS INDICATED? fields are returned in the DISPLAY ONLY QUERY option.

Patch DG\*5.3\*825

#### Display Only Query—Patient Doesn't Exist in PATIENT File (#2)

```
Select Master Patient Index Menu Option: DISPLAY <Enter> Only Query
Is Patient in the PATIENT file ? YES// NO <Enter>
When the patient is NOT in the local PATIENT file, you will be asked
to provide as much information as possible to facilitate the query.
You will be asked for patient name, date of birth, Social Security Number,
gender, phone number, and address. Minimally, you must enter patient name
and date of birth.
                                                                  Accepts upper

Figure 5-42: Display Only Query with an Open Data Management Case

**NOTE:** Patch MPIF\*1\*21 added several fields to the Display Only Query option. They are: claim number, station number of the treating facility; and if there is an Open Data Management case, the case number, caseworker, telephone number, and NOIS number (if there is one).

Figure 5-43 shows the Primary View Display option, located on the Message Exception Menu [RG EXCEPTION MENU]. It is used to remotely view Primary View patient identity fields on the Master Patient Index (MPI). The same functionality described in the previous documentation for the MPI/PD Exception Handling action MPI Primary View, applies to this option. They both behave the same. However, the one difference between them is that the Primary View Display from MPI option offers VA facilities the ability to send remote queries to the MPI to view patient identity data regardless if there is an exception logged for the patient.

```
Select Message Exception Menu Option: Primary View Display from MPI
This option sends a remote request for data to the Master Patient
Index, using a Remote Procedure Call (RPC). When the RPC returns
the information, you can review Primary View data as it currently
exists on the MPI Patient Data Inquiry (PDAT) report.
Choose the patient for whom Primary View data is to be requested.
The selected patient must have an Integration Control Number (ICN).
You can select by Patient Name, Social Security Number, or ICN.
                                                          SC VETERAN

```

Figure 5-43: Primary View Display from MPI [RG PRIMARY VIEW FROM MPI] option

### Why VA Facilities Need to Know the Current Activity Scores for Patient Identity Fields

Patient identity fields in the Primary View of the MPI are evaluated and updated based on scoring and data rules and displayed at the top of the MPI Patient Data Inquiry [MPI DATA MGT PDAT MPI] option.

**NOTE:** For a list of the patient identity fields that make up the Primary View on the MPI, see the section titled "Appendix G: Primary View Identity Traits" in this documentation.

The Primary View score is evaluated based on criteria captured from patient encounters at VA facilities (e.g., active prescriptions, admission or registration in the last year, lab test, or radiology exam in the last year) that are sending the inbound update (i.e., data entered by users or sent from a system of interest) to the MPI. The score is calculated from data updates coming from the site. Data is weighed on a field-by-field basis against any differences on the MPI to determine if the score for the inbound edits is equal to or greater than the score for the existing Primary View. Next, the inbound edit is evaluated against Primary View data rules.

Edits to key patient identity fields accepted for the update to the Primary View are broadcasted out to all systems of interest for that patient that do not already have the updated data. Data that does not meet or exceed the current score and pass the data rules generate reject exceptions, which are sent back to the site that attempted the edit. This creates an exception type in the MPI/PD Exception Handling option named View PV Rej Detail (PVR). This exception shows them when their edit was rejected and why.

Site edits to patient identity data that have existing activity scores equal to 1000 will cause those edits to reject. Access to the MPI Patient Data Inquiry [MPI DATA MGT PDAT MPI] option allows sites to see the current activity scores providing an understanding why an edit isn't working and is causing a reject exception.

# Management Reports...

### [RG MGT REPORTS]

This menu contains management reports for the MPI/PD Patient Administration Coordinator.

```
Select MPI/PD Patient Admin Coordinator Menu Option: RPT <Enter> Management Reports
          Pseudo-SSN Report
          Link and Process Status Display
          Unresolved Exception Summary
          National ICN Statistics
Select Management Reports Option:
```

Figure 5-44: Management Reports Menu on MPI/PD VistA

#### Pseudo-SSN Report

#### [RGPR PRE-IMP SSN REPORT]

The Pseudo SSN Report identifies patients with questionable SSNs. The completed report sorts patients by Patient Activity and then by the patient's Primary Eligibility Code. The report identifies ALL patients in the database with a missing, pseudo, or potentially false SSN and further identifies patients with inpatient and/or outpatient activity over the past 3 years. The report also identifies entries in the PATIENT file (#2) with a "B" cross-reference and no zero node entry and displays the patient record IEN (Internal Entry Number) within the first section of the report. This first section should be provided to your station's IRM service for their information. The following example shows the output from the report.

```
Select Management Reports Option: Pseudo <Enter> -SSN Report
This report will provide a list of:
(1) any B Cross-references (there is no 'zero' node but a B x-ref)
    on the patient file,
(2) patients with Pseudo SSNs who have not had activity within the past 3
years,
(3) patients with Pseudo SSNs who have had activity within the past 3 years.
The Reports are sorted by Primary Eligibility Code. The report can
be queued if desired.
For MPI/PD purposes, general advice is to concentrate first on
getting correct SSNs for the patients who HAVE had activity within
the past 3 years.

Figure 5-45: Pseudo-SSN Report

This report should be printed and provided to personnel assigned to update the Social Security Numbers (SSN). These users would contact the patient and use the Load/Edit Patient Data option in the Admission,

Discharge, Transfer (ADT) Registration menu to update the SSN. It is suggested that sites first clean up those with activity = YES and prioritize the cleanup for patients with veteran Primary Eligibility Codes.

#### **Link and Process Status Display**

#### [RG LINKS AND PROCESS DISPLAY]

This option is used to monitor the status of MPI/PD related functions and messaging. The monitor displays the following information.

- HL links that currently have messages to be processed on either the inbound or outbound queues and the current STATE of the link
- Status of MPI/PD background jobs
- Current audit status on the NAME field (#.01) in the PATIENT file (#2)
- Current status of the SEND parameters for HL7 messaging
- Local link management information
- Any Logical Links used for MPI/PD Messaging that don't have an INSTITUTION defined
- Any Logical Links used for MPI/PD messaging that have an incorrect INSTITUTION defined
- Any Non-MPI/PD Links that have an INSTITUTION definition of the local sites

```
Select MPI/PD IRM Menu Option: Link <Enter> and Process Status Display
Logical Link Monitor:
================
<<Run - Oct 28, 2002@13:39:56>>
Outgoing messages:
Incoming messages:
MPI/PD Process Monitor:
Checking VAFC BATCH UPDATE background job...

=> STOP MPI/PD MESSAGING currently set to << SEND MESSAGES >>.
Checking SHUTDOWN LLP? field and TCP/IP SERVICE TYPE for VADCRN...
=> SHUTDOWN LLP? currently set to << NO >>.
=> TCP/IP SERVICE TYPE currently set to << SINGLE LISTENER >>.
=> Logical Link MPIVA currently set to << TCP >>.
=> HL LINK MANAGER is currently << RUNNING >>.
```

Figure 5-46: Link and Process Status Display option

**NOTE:** Patch RG\*1\*20 has added the Link and Process Status Display option to both the MPI/PD IRM Menu and the MPI/PD Patient Admin Coordinator Menu. Once a Class III utility, Link and Process Status Display is used to monitor the status of MPI/PD related functions and messaging. The data provided by this option can also be generated from the Master Patient Index (MPI), via a remote procedure call, for use by the MPI Data Quality Management team.

Unresolved Exception Summary	[RG STATUS DISPLAY]
------------------------------	---------------------

The Unresolved Exception Summary calculates and presents the following data:

- Number of unresolved exceptions in the CIRN HL7 EXCEPTION LOG file (#991.1) for the MPI/PD related entries (e.g., internal entry number 234) in the CIRN HL7 EXCEPTION TYPE file (#991.11).
- Number of unique patients with exceptions.

The Exception Handler and Patient Data Review numbers indicate how up-to-date a site is in exception resolution. This data can be useful in reducing the number of exceptions.

Figure 5-47: Unresolved Exception Summary

**NOTE:** As of VistA Patch RG\*1\*43, all existing exceptions that were active in the CIRN HL7 EXCEPTION LOG file (#991.1) of the types listed below, were marked with a status of PROCESSED:

- Required field(s) missing for patient sent to MPI
- SSN Match Failed
- Name Doesn't Match

These three exceptions listed are no longer generated.

Existing patient records that had these exceptions at the time of in installation of RG\*1\*43 were sent to the MPI again, and under the latest business rules, were assigned ICNs. At this point, if appropriate, these records received a new Potential Matches Returned exception for site personnel to review.

#### **National ICN Statistics**

#### [RG NATIONAL ICN STATISTICS]

This option provides the following statistics available for facility review:

- Total number of patients assigned to each unique Coordinating Master of Record (CMOR).
- Total number of patients shared with each unique entry in the TREATING FACILITY LIST file (#391.91).
- Totals for national ICNs, local ICNs, and patients with no ICN.

This data is compiled by a remote process, initiated by the MPI in Austin on a regular basis for reporting purposes. The local site does not compile it; however, that same site can view the last report that was compiled.

**NOTE:** Patch RG\*1\*20 has removed the Treating Facility List Statistics [RGMT AUDIT TF STATISTICS] option from the Management Reports [RG MGT REPORTS] menu. This information is now available on the new National ICN Statistics [RG NATIONAL ICN STATISTICS] option.

```
Select Management Reports Option: National <Enter> ICN Statistics
This option provides the following statistics:
  1. Total patients assigned to each unique COORDINATING MASTER OF
      RECORD (CMOR).
   2. Total patients shared with each unique entry in the TREATING
      FACILITY LIST (#391.91) file.
   3. Totals for national ICNs, local ICNs, and patients with no ICN.
===> NOTE <===
This data was last compiled on Aug 08, 2002@15:30:23
Right Margin for this report is 80.

#### **Add/Edit Point of Contact**

### [RG UPDATE POINT OF CONTACT]

This option allows a facility to update their point of contact information for Master Patient Index/Patient Demographics (MPI/PD). Names and phone numbers can be edited for administrative, IRM, HL7, and alternate contacts. Phone numbers should include the entire number, to include the area code, seven digit number and extension (e.g., 999 999 9999). At the conclusion of the edit process, the information is transmitted to a remote mail group on the Austin MPI system. The Healthcare Identity Management (HC IdM) staff will use this information to update the MPI points of contact on the HC IdM Web site:

http://vista.med.va.gov/mpi\_dqmt/cirn\_points\_of\_contact.htm

The COMMERCIAL PHONE field (#.135) can also be edited by IRM using the Edit an Existing User [XUSEREDIT] option, but this doesn't send a message to the Healthcare Identity Management team. The message is sent only through the use of the Add/Edit Point of Contact [RG UPDATE POINT OF CONTACT] option. It may be advisable to periodically (e.g., quarterly) compare what is in your local system with the information on the Web site and update if needed. If the number on the Web site doesn't match what is currently in your system, you would need to delete the Point of contact (POC) and re-enter the name, because only a change causes a message to be sent. The Healthcare Identity Management team will use this information to update their Web site.

```
Select MPI/PD Patient Admin Coordinator Menu Option: ADD/EDIT <Enter> Point of
Contact
This option allows you to transmit information to the MPI/PD Data
Management team so that the Point of Contact website can be updated.
To obtain a list of MPI/PD Points of Contact for each facility,
look for the POC web link on the MPI/PD Home Page.
The COMMERCIAL PHONE (#.135) field in the NEW PERSON (#200) file
will only accept numbers and punctuation, 4-20 characters.
Please include the entire phone number:
area code, 7 digit number and extension (e.g., AAA NNN NNNN XXXX)
A contact name without a phone number will NOT be transmitted.
Select one or more of the following:
(A list or range of numbers can be entered, e.g., 1,3 or 2-4,6.)
    1 - Admin POC 2 - Alt Admin POC 3 - IRM POC

```

Figure 5-51: Link and Process Status Display

**NOTE:** Patch RG\*1\*20 has added the Class I option, Link and Process Status Display, to both the MPI/PD IRM Menu and the MPI/PD Patient Admin Coordinator Menu. Once a Class III utility, Link and Process Status Display is used to monitor the status of MPI/PD related functions and messaging. The data provided by this option can also be generated from the Master Patient Index (MPI), via a remote procedure call, for use by the Healthcare Identity Management team.

**April** 1999

# Unresolved Exception Summary

### [RG STATUS DISPLAY]

The Unresolved Exception Summary calculates and presents totals for the following data:

- Unresolved exceptions in the CIRN HL7 EXCEPTION LOG file (#991.1) for the MPI/PD related entries (e.g., internal entry number 234) in the CIRN HL7 EXCEPTION TYPE file (#991.11).
- Unique patients with exceptions.

The Exception Handler numbers indicate how up-to-date a site is in exception resolution. This data can be useful in reducing the number of exceptions.

Figure 5-52: Unresolved Exception Summary

**NOTE:** Patch RG\*1\*20 has revised the MPI/PD Status Display [RG STATUS DISPLAY] option. The link and processes information has been removed from this display, as that data is now available on the new Link and Process Status Display [RG LINKS & PROCESS DISPLAY] option. The menu text for this option has been changed from MPI/PD Status Display to Unresolved Exception Summary.

# **Standalone Options**

# MPI/PD HL7 EXCEPTION NOTIFIER [RG EXCEPTION NOTIFIER]

This option is used to notify members of the RG CIRN DEMOGRAPHIC ISSUES Mail Group that there are exceptions to review. It is not a user option and should *not* be added to user menus.

# MPI/PD EXCEPTION PURGE [RG EXCEPTION PURGE]

This option purges entries from the CIRN HL7 EXCEPTION LOG file (#991.1). Entries that are purged include duplicate entries, resolved entries over 30 days old, and entries for patients where the name field is null or the patient has been merged (e.g., has a -9 node.) Additionally, only the most recent Primary View Reject exception for a given patient/date is retained.

The MPI/PD EXCEPTION PURGE [RG EXCEPTION PURGE] option should be scheduled to run once an hour via Task Manager. Contact Information Resource Management (IRM) to verify that this job is scheduled and running.

# LOCAL/MISSING ICN RESOLUTION [MPIF LOC/MIS ICN RES]

This option will start the background job of resolving local and missing ICNs against the MPI. It should *not* be attached to any menu. It is recommended that this option be scheduled to run via TaskMan every 600 seconds (Patch MPIF\*1\*35).

- NOTE: As of Patch MPI\*1\*38, this background job no longer automatically adds patients to the MPI. Previous to the release of this patch, when the Local/Missing ICN Resolution job was processed on the MPI, if a match wasn't found, the patient was added immediately. As of Patch MPI\*1\*38, this functionality has been changed in that if a match for a patient isn't found on the MPI, a message is sent back to the site indicating this. On the site's side, this triggers an HL7 A28—Add Patient message, which then adds the patient to the MPI.
- NOTE: A new field, LOCAL/MISSING DATE LAST RAN (#.04), was created in the CIRN SITE PARAMETER file (#991.8) in patch RG\*1\*23 to hold the last date the Local/Missing ICN Resolution Background job ran. The field will be populated by the routine ^MPIFRES.

#### MPI/PD HL7 DIAGNOSTIC MENU

#### [RGMT DIAG MGR]

This standalone menu contains a diagnostic tool and reports to assist with problem resolution for MPI/PD VistA HL7 messaging. It should *not* be attached to any menu. This diagnostic tool will be used primarily by the MPI/PD VistA development team and EPS.

```
Select MPI/PD HL7 Diagnostic Menu Option:
          Compile MPI/PD HL7 Data
  RPT
         MPI/PD HL7 Message Status Report
  SNG
         MPI/PD HL7 Activity by Patient/Single Protocol
         MPI/PD HL7 Activity by Patient/All Protocols
  AT.T.
Select MPI/PD HL7 Diagnostic Menu Option:
```

Figure 5-53: MPI/PD HL7 Diagnostic Menu options

#### COMPILE MPI/PD HL7 DATA

#### [RGMT DIAG COMPILE HL7 DATA]

This utility searches the HL7 MESSAGE TEXT file (#772) for a selected date range. Each HL7 message in the date range is examined. If the RELATED EVENT PROTOCOL field contains the MPI/PD protocols (e.g., "VAF", "RG", or "MPI") data is compiled into the ^XTMP("RGMT", "HL" array. This option should not be attached to any menu.

A cross-reference is built on patient ICN and DFN for faster data retrieval for the associated reports.

#### MPI/PD HL7 MESSAGE STATUS REPORT

#### [RGMT DIAG STATUS REPORT]

This option prints information found during the COMPILE MPI/PD HL7 DATA option. It should not be attached to any menu. The MPI/PD HL7 MESSAGE STATUS REPORT is generated from the ^XTMP("RGMT","HL" array. The report is sorted by RELATED EVENT PROTOCOL, date, transmission type, and status.

Either a detailed or summary report can be printed for a selected date range. The summary report displays the total number of messages for each date, transmission type, and status. The right margin for this report is 80.

The detailed report can be printed for a single or all protocols and includes information from each HL7 message. The detailed report displays the related EVENT PROTOCOL, DATE, TRANSMISSION TYPE, STATUS, MESSAGE HEADER DATE, DATE PROCESSED, INTERNAL ENTRY NUMBER (IEN) from the HL7 MESSAGE TEXT file (#772), message identification number, and whether or not the message has been purged. The right margin for this report is 132.

MPI/PD HL7 ACTIVITY BY PATIENT/SINGLE	[RGMT DIAG SINGLE PROTOCOL]
PROTOCOL	

This option prints information found during the COMPILE MPI/PD HL7 DATA compilation for activity related to a specific protocol. It should *not* be attached to any menu. The ^XTMP("RGMT","HL" array is searched for a user selected protocol, date range, transmission type and patient.

The report prints the patient's name, protocol, date range, transmission type, internal entry number (IEN) from the HL7 MESSAGE TEXT file (#772), the date and status. The HL7 message data found in the MESSAGE TEXT field is displayed. The right margin for this report is 80.

MPI/PD HL7 ACTIVITY BY PATIENT/ALL	[RGMT DIAG ALL PROTOCOLS]
PROTOCOLS	

This option prints information found during the COMPILE MPI/PD HL7 DATA compilation for activity related to ALL protocols. It should *not* be attached to any menu. The ^XTMP("RGMT","HL" array is searched for a user selected patient and date range.

The report prints the patient's name, date range, protocol, transmission type, internal entry number (IEN) from the HL7 MESSAGE TEXT file (#772), the date and status. The HL7 message data found in the MESSAGE TEXT field is displayed. The right margin for this report is 80.

**April** 1999

# Chapter 6: Background Jobs

# **AUTO CHANGE CMOR NIGHT JOB Obsolete w/MPIF\*1\*44**

Background job: [MPIF CMOR REQUEST AUTO JOB]

# Informational Patch MPIF\*1\*47: Reschedule MPIF CMOR REQUEST **AUTO JOB**

As of Patch MPIF\*1\*44, the MPIF CMOR REQUEST AUTO JOB was made obsolete, marking it out of order. Informational Patch MPIF\*1\*47 is being sent requesting that MPIF CMOR REQUEST AUTO JOB be rescheduled until outstanding CMOR Change Requests are processed. Sites can still make CMOR Change Requests until they install MPIF\*1\*44. When all facilities have patch MPIF\*1\*44 installed, this will no longer be an issue, and the option can again be unscheduled and placed out of order.

- 1. Place the MPIF CMOR REQUEST AUTO JOB option back in order by removing the OUT OF ORDER MESSAGE text from the OPTION (#19) file.
- 2. Then reschedule the MPIF CMOR REQUEST AUTO JOB via TaskMan with a frequency of once per day after normal working hours (1D).
- **NOTE:** RG\* and MPIF\* patches should NOT be installed on legacy systems to avoid issues with the legacy systems ending up as Treating Facilities.
- **NOTE:** MPIF\*1\*44 must be installed before acting on this patch.

The following jobs need to be tasked to run in the background in support of MPI/PD.

# LOCAL/MISSING ICN RESOLUTION

Background job: [MPIF LOC/MIS ICN RES]

This option starts a background job that assigns ICNs to the following types of patient records, which have not been sent to the MPI:

- Patient records that have local ICNs
- Patient records that have been flagged as being active but do not have an ICN assignment.

It is recommended that this option be scheduled to run via TaskMan every 600 seconds (Patch MPIF\*1\*35).

NOTE: As of Patch MPI\*1\*38 (MPI Austin side for the MPIF\*1\*43 and RG\*1\*43), this background job no longer automatically adds patients to the MPI.

Previous to the release of this patch, when the Local/Missing ICN Resolution job was processed on the MPI, if a match wasn't found, the patient was added immediately. As of Patch MPI\*1\*38, this functionality has been changed in that if a match for a patient isn't found on the MPI, a message is sent back to the site indicating this. On the site's side, this triggers an HL7 A28—Add Patient message, which then adds the patient to the MPI.

NOTE: A new field, LOCAL/MISSING DATE LAST RAN (#.04), was created in the CIRN SITE PARAMETER file (#991.8) to hold the last date the Local/Missing ICN Resolution Background job ran. The field will be populated by the routine ^MPIFRES.

#### Local ICNs

ICNs are created for new patients locally at the site when the MPI is unavailable or when the connection is lost prior to the assignment an ICN (e.g., the Direct Connect could not be established). A local ICN is also assigned as a placeholder when a patient has been sent to the MPI but not yet added. This is to ensure identification of these patients as these records await a response from the MPI. Local ICNs look like a national ICN. They contain the same number of digits as a national ICN. The only difference is that the first three digits are the VAMCs station number.

**NOTE:** It is not recommended that local ICNs be sent to remote databases as they will only be known at the local facility that assigned them.

#### **Missing ICNs**

Missing ICNs result from patient records which have been added to the PATIENT file (#2) via other means than through the Patient Information Management System (PIMS) options that establish the realtime connection with the MPI (Load/Edit Patient Data, Register a Patient, and Electronic 10-10EZ Processing). These records are flagged internally for inclusion in the Local/Missing ICN Resolution job.

#### **Resolution of Local/Missing ICNs**

The Local/Missing ICN Resolution background job should be scheduled via TaskMan to run every 600 seconds (Patch MPIF\*1\*35). The Local/Missing ICN Resolution job will find either of the following:

- All patient entries in the local PATIENT file (#2) with a local ICN
- Patient entries that have been flagged as missing an ICN

It then sends these patients to the MPI for a national ICN assignment. These patient entries are sent to the MPI requesting an ICN, in batch HL7 messages (maximum of 100 patient entries each). They are processed on the MPI in the same manner as the patient entries presented in the real-time connection, only in batch form instead of individual entries.

**April** 1999

## MPI/PD EXCEPTION PURGE

[RG EXCEPTION PURGE]

This option purges entries from the CIRN HL7 EXCEPTION LOG file (#991.1). Entries that are purged include duplicate entries, resolved entries over 30 days old, and entries for patients where the name field is null or the patient has been merge (e.g., has a -9 node.) Additionally, only the most recent Primary View Reject exception for a given patient/date is retained.

The MPI/PD EXCEPTION PURGE [RG EXCEPTION PURGE] option should be scheduled to run once an hour via Task Manager. Contact Information Resource Management (IRM) to verify that this job is scheduled and running.

## UPDATE BATCH JOB FOR HL7 v2.3

[VAFC BATCH UPDATE]

The event of updating patient information can take place from several different options within VistA, including VA FileMan. Changes to any of the fields listed in Table 6-1 are recorded and an entry is created in the ADT/HL7 PIVOT file (#391.71) . The entry is then marked as pending transmission. Direct sets to the globals cannot be collected. This background job will periodically collect (via a scheduled job) these marked events and broadcast an ADT-A08 Update Patient Information message. Because it is not possible to determine if the editing of the field is complete, this background job will periodically collect these marked events and broadcast an ADT A08 message (i.e., Update Patient Information). This is a PIMS-generated HL7 message.

Field Number	Field Name
.01	NAME
.02	SEX
.03	DATE OF BIRTH
.05	MARITAL STATUS
.08	RELIGIOUS PREFERENCE
.09	SOCIAL SECURITY NUMBER

991.02	ICN CHECKSUM
991.03	COORDINATING MASTER OF RECORD
994	MULTIPLE BIRTH INDICATOR (added with Patch DG*5.3*575)
1901	VETERAN (Y/N)?

Table 6-1: Data elements monitored in the PATIENT file (#2) for changes

This background job also sends out Treating Facility "add me" and Treating Facility Update messages.

**NOTE:** For more information on the ADT A08 Message- Update Patient Information, see the *Master Patient Index (MPI) VistA HL7 Interface Specifications* at the following address:

http://www.va.gov/vdl/application.asp?appid=16

**NOTE:** This background job was originally exported in patch DG\*5.3\*91.

# Chapter 7: PIMS Options

This chapter documents in detail the daily interaction between the Master Patient Index (MPI) and the following Patient Information Management System (PIMS) options:

- Load/Edit Patient Data [DG LOAD PATIENT DATA]
- Register a Patient [DG REGISTER PATIENT]
- Electronic 10-10EZ Processing [EAS EZ 1010EZ PROCESSING]

Two other PIMS options that do not interact with, but are impacted by the MPI are listed below. The computer dialogue resulting from these options show the Coordinating Master of Record (CMOR) only.

- Patient Inquiry [DG PATIENT INQUIRY]
- Preregister a Patient [DGPRE PRE-REGISTER OPTION]

## Overview of PIMS Interaction with the MPI

During the daily operations of the MPI, a real-time TCP/IP connection (Direct Connect) to the index is established via the Patient Information Management System (PIMS) options Load/Edit Patient Data, Register a Patient, and Electronic 10-10EZ Processing. This takes place when using these PIMS option to add patients to the PATIENT file (#2), or when selecting patients that already exist in the PATIENT file (#2), but do not have an Integration Control Number (ICN)—local ICN or national ICN. This direct connection to the MPI makes it possible for the immediate return of an ICN for a patient that does not currently have one assigned in your site's PATIENT file (#2).

Each time a patient is checked against the MPI via any one of these PIMS options, one of the following scenarios will occur:

#### 1. Patient is Not Found on the MPI:

The patient is assigned an ICN and added to the index.

Figure 7-1 shows the process for adding a new patient to the MPI and getting an ICN assignment.

**NOTE:** The process for adding a new patient to the MPI is the same for each of the three PIMS options listed in this chapter. For the purposes of this example, we are using the PIMS option Register a Patient.

Figure 7-2: Exact Match found on MPI. PATIENT file (#2) updated

## 3. MPI has Potential Match(es) to Patient's Identifying Information:

- a. The patient is assigned a new ICN and added to the index.
- b. A potential match exception is logged for HC IdM to review.
- NOTE: As of MPI/PD Patch MPIF\*1\*52, all screens and actions associated with the MPI/PD Exception Handler functionality for resolving Potential Match Exceptions have been removed from MPI/PD VistA. This functionality is now supported in the IMDQ Toolkit.
- NOTE: As of VistA Patch RG\*1\*43, all existing exceptions that were active in the CIRN HL7 EXCEPTION LOG file (#991.1) of the types listed below, were marked with a status of PROCESSED:
  - Required field(s) missing for patient sent to MPI
  - SSN Match Failed
  - Name Doesn't Match

These three exceptions listed are no longer generated.

Existing patient records that had these exceptions at the time of in installation of RG\*1\*43 were sent to the MPI again, and under the latest business rules, were assigned ICNs.

# PIMS Option: Load/Edit Patient Data

This section describes the interaction of the MPI and the Patient Information Management System (PIMS) option Load/Edit Patient Data. The user attempting to do the following:

- 1. Add a patient to the local PATIENT file (#2) and to the MPI for the first time.
- 2. Select a patient record for processing that currently exists in the local PATIENT file (#2) and who already has an ICN.

#### **Add New Patient to MPI for First Time**

Figure 7-3 shows a new patient being added to the PATIENT file (#2) using the PIMS option Load/Edit Patient Data. The patient is being added to the MPI for the first time. The MPI will return an ICN for that patient. Boldface text shows that the following procedures are taking place:

- A connection is made to the MPI.
- There is currently no matching patient entry in the MPI for this patient.
- The patient is added to the MPI.

Once a patient has been added to the MPI, the corresponding ICN field in the PATIENT file (#2) is updated.

Figure 7-3: Load/Edit Patient Data-Add patient to PATIENT file (#2) and MPI for first time

#### **Process Existing Patient Already on MPI**

Figure 7-4 shows that once patients have been added to the MPI, they are assigned an ICN. Anytime the PIMS option Load/Edit Patient Data (or any of the other two PIMS options: Register a Patient, or Electronic 10-10EZ Processing) is used to process an existing patient that has an ICN.

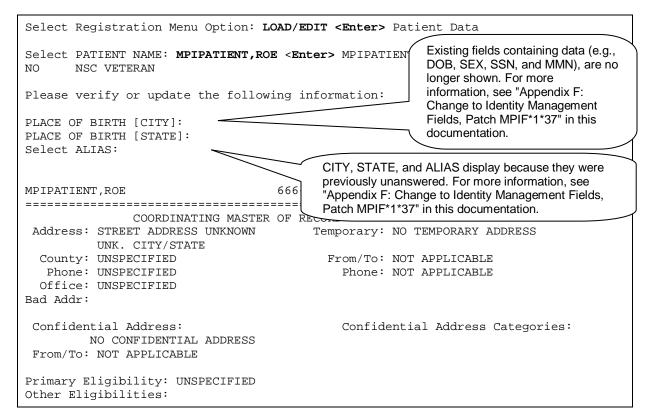

Figure 7-4: Load/Edit Patient Data—Select patient for processing already having ICN and CMOR

## **PIMS Option: Register a Patient**

This topic describes the interaction between the MPI and the Patient Information Management System (PIMS) option Register a Patient when processing an existing patient. This patient does not have an ICN assignment.

Boldface is used to highlight user responses to online prompts. It is also used to highlight computer dialogue that is new to this PIMS option based on its interaction with the MPI, showing:

- 1. A connection being made to the MPI.
- 2. That there are currently no matching patient entries in the MPI for this patient.
- 3. The patient being added to the MPI.

Once a patient has been added to the MPI, the corresponding ICN field in the PATIENT file (#2) is updated.

## Other PIMS Options Affected by the MPI

The following two Patient Information Management System (PIMS) options do not interact with, but are impacted by the MPI:

- 1. Patient Inquiry [DG Patient Inquiry]
- 2. Preregister a Patient [DGPRE PRE-REGISTER OPTION]

The CMOR for the patients that have been assigned an ICN (local or national) will display in the computer dialogue from these two options. If the patient has not been assigned an ICN, the CMOR field will have a value of None or Unknown.

## **Patient Sensitivity**

If a shared patient is flagged as sensitive at one of the treating facility sites, a bulletin is sent to the RG CIRN DEMOGRAPHIC ISSUES mail group at each treating facility telling where, when, and by whom the flag was set. Each site can then review whether the circumstances meet the local criteria for sensitivity flagging.

## **MPI Direct Connection Unavailable: Local ICN Assignments**

Figure 7-8 shows the computer dialogue resulting from the MPI unexpectedly becoming unavailable while the direct connection is in use. If this happens, a local ICN is assigned to the patient being processed. This allows the user to continue processing the current patient and flags this patient as needing a national ICN. Patient records having received Local ICN assignment will be resolved through the Local/Missing ICN Resolution Background Job (i.e., MPIF LOC/MIS ICN RES).

The process is the same for each of the three PIMS options listed in this chapter. However, we will use the PIMS option Register a Patient for the purposes of this example, Figure 7-8.

```

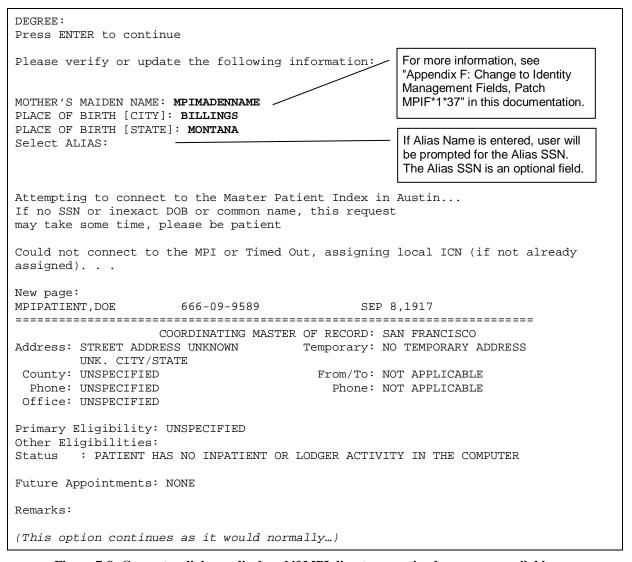

Figure 7-8: Computer dialogue displayed if MPI direct connection becomes unavailable

# **Under What Conditions are Local ICNs Assigned to Patient Records?**

The following are conditions in which local ICNs are assigned to patient records:

- The site's VistA system cannot connect to the MPI.
- The site edits an existing patient or adds a new patient using an option that doesn't directly interact with the MPI (e.g., VistA Laboratory or VA FileMan).
- The site attempts to add a patient; however, something happens to hold up transmission to the
  MPI causing a delay in national ICN assignment. In this instance, a local ICN is assigned as an
  interim placeholder to the patient entry until a national ICN is returned. Local ICN assignments
  made in this situation facilitate these types of patient entries to be easily identifiable.

## Glossary

.001 Field A field containing the internal entry number of the record.

.01 Field The one field that must be present for every file and file entry. It is also called the

NAME field. At a file's creation the .01 field is given the label NAME. This label

can be changed.

10-10EZ Form used to apply for health benefits.

AAC Austin Automation Center (renamed Austin Information Technology Center

[AITC])

**Abbreviated** Response

This feature allows you to enter data by typing only the first few characters for the desired response. This feature will not work unless the information is already

stored in the computer.

Part of the validation and agreement to the privacy regulations associated with **Accept Agreement** 

Identity Management Data Quality Toolkit (IMDQ TK)

Access Code A code that, along with the Verify code, allows the computer to identify you as a

user authorized to gain access to the computer. Your code is greater than 6 and less than 20 characters long; can be numeric, alphabetic, or a combination of both; and is usually assigned by a site manager or application coordinator. It is used by the Kernel's Sign-on/Security system to identify the user (see Verify Code).

**Active Patients** Patients who have been seen at a site within the past three years.

**ADPAC** Automated Data Processing Application Coordinator.

ADR The Administrative Data Repository is a centralized database repository for person

(PATIENT [#2] and NEW PERSON [#200] files). It is the authoritative data store

within VHA for cross-cutting person administrative information. The Administrative Data Repository contains identification and cross-cutting

demographics data as well as other administrative information.

The Administrative Data Repository is a centralized database repository for person **ADR** 

(PATIENT [#2] and NEW PERSON [#200] files). It is the authoritative data store

within VHA for cross-cutting person administrative information. The Administrative Data Repository contains identification and cross-cutting

demographics data as well as other administrative information.

**ADT** Admission Discharge and Transfer- Part of the Patient Information Management

System (PIMS).

ADT/HL7 PIVOT

Changes to any of the fields of patient information will be recorded and an entry File created in the ADT/HL7 PIVOT file (#391.71). When an update to a patient's

treating facility occurs, this event is to be added to the ADT/HL7 PIVOT file

April 1999 Master Patient Index/Patient Demographics (MPI/PD) VistA User Manual Version 1.0 Patch DG\*5.3\*825

(#391.71) and marked for transmission. A background job will collect these updates and broadcast the appropriate HL7 message (ADT-A08 Patient Update).

**AITC** 

Austin Information Technology Center (formerly Austin Automation Center [AAC])

Alerts

Brief online notices that are issued to users as they complete a cycle through the menu system. Alerts are designed to provide interactive notification of pending computing activities, such as the need to reorder supplies or review a patient's clinical test results. Along with the alert message is an indication that the View Alerts common option should be chosen to take further action.

**Ancillary Reviewer** 

This can be a single person or group of people given the responsibility to conduct reviews of potential duplicate record pairs with data in files other than the PATIENT file (#2). For example, selected personnel in Laboratory, Radiology, and Pharmacy.

**ANSI** 

American National Standards Institute.

ANSI M

The M (formerly known as MUMPS) programming language is a standard recognized by the American National Standard Institute (ANSI). M stands for Massachusetts Utility Multi-programming System.

API

Program calls provided for use by application programmers. APIs allow programmers to carry out standard computing activities without needing to duplicate utilities in their own software. APIs also further DBA goals of system integration by channeling activities, such as adding new users, through a limited number of callable entry points. VistA APIs fall into the following three categories:

- The first category is "Supported API" These are callable routines, which are supported for general use by all VistA applications.
- The second category is "Controlled Subscription API." These are callable routines for which you must obtain an Integration Agreement (IA formerly referred to as a DBIA) to use.
- The third category is "Private API," where only a single application is granted permission to use an attribute/function of another VistA package.

These IAs are granted for special cases, transitional problems between versions, and release coordination.

Application Coordinator

Designated individuals responsible for user-level management and maintenance of an application package such as IFCAP, Lab, Pharmacy, Mental Health, etc.

Array

An arrangement of elements in one or more dimensions. An M array is a set of nodes referenced by subscripts that share the same variable name.

AT-SIGN ("@")

A VA FileMan security Access code that gives the user programmer-level access to files and to VA FileMan's developer features. See Programmer Access. Also, the character "@" (i.e., at-sign, Shift-2 key on most keyboards) is used at VA

FileMan field prompts to delete data.

The term "auto-update" refers to fields that are updated from a central **Auto-Update** 

database (i.e., the Master Patient Index).

Batch Acknowledgements

The format of a HL7 batch acknowledgement message consists entirely of a group

of ACK (acknowledgment) messages. In the case of MPI, batch

acknowledgements are returned during the initialization process and during the Local/Missing ICN Resolution job. The background job files the ICN, ICN checksum and CMOR, updates the MPI, and then the associated treating facilities and systems. Data returned from this process constitute the acknowledgment of the

batch message.

**Batch Messages** There are instances when it is convenient to transfer a batch of HL7 messages.

> Common examples related to MPI are queries sent to the MPI for an ICN during the initialization process, the resolution of Local or Missing ICNs, and CMOR Batch Comparisons. Such a batch could be sent online using a common file transfer protocol. In the case of the MPI, the HL7 Batch Protocol uses the Batch Header Segment (BHS) and Batch Trailer Segment (BTS) message segments to

delineate the batch.

BHIE Bidirectional Health Information Exchange

Bulletins Electronic mail messages that are automatically delivered by VistA MailMan

> under certain conditions. For example, a bulletin can be set up to "fire" when database changes occur, such as adding a new Institution in the INSTITUTION

file (#4). Bulletins are fired by bulletin-type cross-references.

**Callable Entry Point** An authorized programmer call that may be used in any VistA application

package. The DBA maintains the list of DBIC-approved entry points.

**CAPRI** Compensation & Pension Records Interchange (CAPRI). This Graphical User

> Interface (GUI) software is used to access veterans' electronic medical records throughout the VA. The Healthcare Identity Management (HC IdM) Team uses CAPRI as a resource for reviewing patient demographic and clinical data.

**CDCO** Corporate Data Center Operations (formerly Corporate Franchise Data Center

[CFD])

**CHDR** Clinical Data Repository (CDR) Health Data Repository

Checksum The result of a mathematical computation involving the individual characters of a

routine or file.

Client A single term used interchangeably to refer to the user, the workstation, and the

portion of the program that runs on the workstation. In an object-oriented

environment, a client is a member of a group that uses the services of an unrelated group. If the client is on a local area network (LAN), it can share resources with

another computer (server).

#### Clinical Patient Record System (CPRS)

Clinical Patient Record System provides a computer-based patient record and organizes and presents all relevant data on a patient in a way that directly supports clinical decision-making. CPRS integrates the extensive set of clinical and administrative applications available within VistA.

#### Common Menu

The Common menu consists of options that are available to all users. Entering two question marks at the menus select prompt displays any secondary menu options available to the signed-on user, along with the common options available to all users.

#### Controlled Subscription Integration Agreement

This applies where the IA describes attributes/functions that must be controlled in their use. The decision to restrict the IA is based on the maturity of the custodian package. Typically, these IAs are created by the requesting package based on their independent examination of the custodian package's features. For the IA to be approved, the custodian grants permission to other VistA packages to use the attributes/functions of the IA; permission is granted on a one-by-one basis where each is based on a solicitation by the requesting package. An example is the extension of permission to allow a package (e.g., Spinal Cord Dysfunction) to define and update a component that is supported within the Health Summary package file structures.

#### Correlation

Comparison of person identity traits for multiple records with the Primary View in the ADR and/or MPI databases.

#### COTS

Commercial Off-the-Shelf. COTS refers to software packages that can be purchased by the public and used in support of VistA.

#### **Cross Reference**

There are several types of cross-references available. Most generally, a VA FileMan cross-reference specifies that some action be performed when the field's value is entered, changed, or deleted. For several types of cross-references, the action consists of putting the value into a list; an index used when looking-up an entry or when sorting. The regular cross-reference is used for sorting and for lookup; you can limit it to sorting only.

#### Data

A representation of facts, concepts, or instructions in a formalized manner for communication, interpretation, or processing by humans or by automatic means. The information you enter for the computer to store and retrieve. Characters that are stored in the computer system as the values of local or global variables. VA FileMan fields hold data values for file entries.

#### **Data Attribute**

A characteristic unit of data such as length, value, or method of representation. VA FileMan field definitions specify data attributes.

## Data Dictionary (DD)

The Data Dictionary is a global containing a description of the kind of data that is stored in the global corresponding to a particular file. VA FileMan uses the data internally for interpreting and processing files.

It contains the definitions of a file's elements (fields or data attributes), relationships to other files, and structure or design. Users generally review the definitions of a file's elements or data attributes; programmers review the

Patch DG\*5.3\*825

definitions of a file's internal structure.

**Data Dictionary** Access

A user's authorization to write/update/edit the data definition for a computer file.

Also known as DD Access.

This term refers to the condition of patient records in terms of completeness and **Data Integrity** 

correctness. It also refers to the process in which a particular patient's data is

synchronized at all the sites in which that patient receives care.

A specific field or type of information, such as Name, Social Security Number, Data Type

Database A set of data, consisting of at least one file, that is sufficient for a given purpose.

> The VistA database is composed of a number of VA FileMan files. A collection of data about a specific subject, such as the PATIENT file (#2); a data collection has different data fields (e.g. patient name, SSN, Date of Birth, and so on). An

organized collection of data about a particular topic.

Database

**Management System** (DBMS)

A collection of software that handles the storage, retrieval, and updating of records in a database. A Database Management System (DBMS) controls redundancy of records and provides the security, integrity, and data independence of a database.

**Database**, National A database that contains data collected or entered for all VHA sites.

Date of Death A patient may be entered as deceased at a treating facility. If a shared patient is

> flagged as deceased, an RG CIRN DEMOGRAPHIC ISSUES bulletin is sent to each treating facility telling where, when, and by whom the deceased date was entered. Each site can then review whether the patient should be marked as

deceased at their site.

**DBA** Database Administrator, oversees software development with respect to VistA

Standards and Conventions (SAC) such as namespacing. Also, this term refers to

the Database Administration function and staff.

DBIA Database Integration Agreement (see Integration Agreements [IA]).

**Default** Response the computer considers the most probable answer to the prompt being

> given. It is identified by double slash marks (//) immediately following it. This allows you the option of accepting the default answer or entering your own answer. To accept the default you simply press the Enter (or Return) key. To

change the default answer, type in your response.

Identifying descriptive data about a patient, such as: name, sex, date of birth, **Demographic Data** 

marital status, religious preference, SSN, address, etc.

**Demographics** Information about a person, such as name, address, service record, next of kin, and

so on.

Department of

The Department of Veterans Affairs (formerly known as the Veterans

**Veterans Affairs** Administration.) Device

Peripheral connected to the host computer, such as a printer, terminal, disk drive, modem, and other types of hardware and equipment associated with a computer. The host files of underlying operating systems may be treated like devices in that they may be written to (e.g., for spooling).

**DHCP** 

Decentralized Hospital Computer Program (now known as Veterans Health Information Systems and Technology Architecture [VistA]). VistA software, developed by VA, is used to support clinical and administrative functions at VA Medical Centers nationwide. It is written in M and, via the Kernel, runs on all major M implementations regardless of vendor. VistA is composed of packages that undergo a verification process to ensure conformity with namespacing and other VistA standards and conventions.

**Dictionary** 

Database of specifications of data and information processing resources. VA FileMan's database of data dictionaries is stored in the FILE of files (#1).

**Direct Connect** 

The Direct Connect is a real-time TCP/IP connection to the MPI to allow for an immediate request for an ICN. Direct Connect is activated when using any of the following PIMS options:

- Register A Patient,
- Load/Edit Patient Data,
- Electronic 10-10EZ Processing,

and when using the:

• Display Only Query

**Direct Mode Utility** 

A programmer call that is made when working in direct programmer mode. A direct mode utility is entered at the MUMPS prompt (e.g., >D ^XUP). Calls that are documented as direct mode utilities cannot be used in application software code.

**DoD** Department of Defense.

**Domain** A site for sending and receiving mail.

**Double Quotes** ("") Symbol used in front of a Common option's menu text or synonym to select it

from the Common menu. For example, the five-character string "TBOX" selects

the User's Toolbox Common option.

Duplicate Record Merge: Patient Merge Patient Merge is a VistA application that provides an automated method to eliminate duplicate patient records within the VistA database (i.e., the VistA

PATIENT file [#2]).

**DUZ** Local variable holding the user number that identifies the signed-on user.

**DUZ(0)** Local variable that holds the File Manager Access Code of the signed-on user.

**EIE** Enterprise Infrastructure Engineering

Electronic Signature

Code

Secret password that some users may need to establish in order to sign documents

via the computer.

**Eligibility Codes** Codes representing the basis of a patient's eligibility for care.

**Encryption** Scrambling data or messages with a cipher or code so that they are unreadable

without a secret key. In some cases encryption algorithms are one directional, that

is, they only encode and the resulting data cannot be unscrambled (e.g.

access/verify codes).

**Entry** VA FileMan record. An internal entry number (IEN, the .001 field) uniquely

identifies an entry in a file.

**EPG** Engineering Process Group (EPG) (formerly known as Software Engineering

Process Group [SEPG]).

**Error Trap** A mechanism to capture system errors and record facts about the computing

context such as the local symbol table, last global reference, and routine in use. Operating systems provide tools such as the %ER utility. The Kernel provides a generic error trapping mechanism with use of the ^%ZTER global and ^XTER\* routines. Errors can be trapped and, when possible, the user is returned to the

menu system.

**ESR** Enrollment Systems Redesign is a centralized and Reengineered enrollment

system.

**EVC** Enrollment VistA Changes

**EVS** Enterprise VistA Support (renamed to Product Support)

**Exception** A task that has encountered an error in personal data. Any Data Quality issue that

requires detailed documentation. HC IdM finds an Exception based on business

rules.

**Exception Message** MPI/PD VistA generates messages and bulletins to alert the user to problems that

occur in generating or processing HL7 messages. The MPI/PD Message Exception

Menu contains options to manage the problems.

**Extrinsic Function** Extrinsic function is an expression that accepts parameters as input and returns a

value as output that can be directly assigned.

**Facility** Geographic location at which VA business is performed.

**FHIE** Federal Health Information Exchange

**Field** HL7: An HL7 field is a string of characters defined by one of the HL7 data types.

VistA: In a record, a specified area used for the value of a data attribute. The data

specifications of each VA FileMan field are documented in the file's data

dictionary. A field is similar to blanks on forms. It is preceded by words that tell

you what information goes in that particular field. The blank, marked by the cursor

on your terminal screen, is where you enter the information.

A field entry may also have discernable parts or components. For example, the **Field Components** 

patient's name is recorded as last name, first name, and middle initial, each of which is a distinct entity separated by a component delimiter (sub-subfield in astm

e1238-94).

Set of related records treated as a unit. VA FileMan files maintain a count of the File

number of entries or records.

File Manager (VA

FileMan)

VistA's Database Management System (DBMS). The central component of Kernel

that defines the way standard VistA files are structured and manipulated.

**FORM** Please refer to the Glossary entry for "ScreenMan Forms."

**FORUM** The central E-mail system within VistA. Developers use FORUM to communicate

at a national level about programming and other issues. FORUM is located at the

OI Field Office—Washington, DC (162-2).

Free Text A DATA TYPE that can contain any printable characters.

Global Address List. GAL

Global Variable Variable that is stored on disk (M usage).

**GUI** Graphical User Interface.

**Health Level 7** (HL7) Batch **Protocol** 

Protocol utilized to transmit a batch of HL7 messages. The protocol generally uses FHS, BHS, BTS and FTS segments to delineate the batch. In the case of the MPI,

the protocol only uses the BHS and BTS segments.

Health Level Seven

(HL7)

National standard for electronic data exchange/messaging protocol. HL7 messages

are the dominant standard for peer-to-peer exchange of clinical, text-based

information.

**Health Level Seven** 

(HL7) VistA

Messaging system developed as VistA software that follows the HL7 Standard for

data exchange.

The next generation of VistA, Healthe Vet-VistA, will retain all of the capabilities Healthe Vet-VistA

> of legacy VistA but will provide enhanced flexibility for future health care and compliance with the One VA Enterprise Architecture. It will allow seamless data

sharing between all parts of VA to benefit veterans and their families.

HEC Health Eligibility Center.

Entries in the HELP FRAME file (#9.2) that can be distributed with application **Help Frames** 

packages to provide online documentation. Frames can be linked with other

related frames to form a nested structure.

Help Prompt

The brief help that is available at the field level when entering one or more question marks.

**HINQ** 

Hospital Inquiry- The HINQ module provides the capability to request and obtain veteran eligibility data via the VA national telecommunications network. Individual or group requests are sent from a local computer to a remote Veterans Benefits Administration (VBA) computer where veteran information is stored. The VBA network that supports HINQ is composed of four computer systems located in regional VA payment centers.

**HIPAA** 

Health Insurance Portability and Accountability Act

HL7

National standard for electronic data exchange/messaging protocol.

HLO

HL7 Optimized. VistA HL7 package routines.

**ICN** 

Patients are assigned a unique identifier, known as an Integration Control Number (ICN), within the process of being added to the MPI database. This number links patients to their records across VHA systems. The Integration Control Number is a unique identifier assigned to patients when they are added to the MPI. The ICN follows the ASTM-E1714-95 standard for a universal health identifier.

ICN/VPID

A combination of Integration Control Number and Veterans Administration Personal Identifier used to uniquely identify a person or record.

**ID State** 

An attribute of the Primary View, which describes whether the Primary View is Permanent, Temporary, or Deactivated. ID State is composed of the following two fields from the MPI VETERAN/CLIENT file (#985):

- ID STATE (#80) is a set of codes: PERMANENT, TEMPORARY, and DEACTIVATED. Auditing is enabled for this field.
- DATE OF ID STATE (#81) identifies when the ID STATE field was last updated.

**Identity Hub** 

Initiate's Probabilistic Algorithm implementation.

**IMDQ** 

New name:
"Healthcare Identity
Management (HC
IdM)"

The Identity Management Data Quality Team (renamed the Healthcare Identity Management Team) is a group of Data Management Analysts committed to improving and safeguarding the quality and accessibility of patient data throughout the VA enterprise. They are involved in many data quality initiatives, but their primary role is to assist VHA facilities in all matters related to the MPI.

**IMDQ** Toolkit

Identity Management Data Quality ToolKit. The IMDQ Toolkit will provide functionality to allow HC IdM staff to search and view identity and exception information in ADR. This includes the ability to view the Primary View record and any associated correlations, correlation data, history, audit trails, and IMDQ Business Rule Events captured by PSIM and MPI. In addition, functionality is provided to support the re-hosting transition for a side-by-side comparison of ADR and MPI information.

Initiate Identity Management software vendor that was selected by the VHA to provide an

Identity Management Probabilistic Algorithm.

Patient who has been admitted to a hospital in order to be treated for a particular **Inpatient** 

condition.

**Input Template** A pre-defined list of fields that together comprise an editing session.

Institution A Department of Veterans Affairs (VA) facility assigned a number by

headquarters, as defined by Directive 97-058. An entry in the INSTITUTION file

(#4) that represents the Veterans Health Administration (VHA).

Integration Agreements (IA)

Integration Agreements define agreements between two or more VistA software applications to allow access to one development domain by another. VistA software developers are allowed to use internal entry points (APIs) or other software-specific features that are not available to the general programming public. Any software developed for use in the VistA environment is required to adhere to this standard; as such, it applies to vendor products developed within the boundaries of DBA assigned development domains (e.g., MUMPS AudioFax). An IA defines the attributes and functions that specify access. The DBA maintains and records all IAs in the Integration Agreement database on FORUM. Content can be viewed using the DBA menu or the Health Systems Design & Development's Web

page.

**Integration Control** Number (ICN)

Patients are assigned a unique identifier, known as an Integration Control Number (ICN), within the process of being added to the MPI database. This number links patients to their records across VHA systems. The Integration Control Number is a unique identifier assigned to patients when they are added to the MPI. The ICN follows the ASTM-E1714-95 standard for a universal health identifier.

**Internal Entry** Number (IEN) The number used to identify an entry within a file. Every record has a unique internal entry number.

Information Resource Management. A service at VA medical centers responsible **IRM** 

for computer management and system security.

ISO Information Security Officer.

ISS Infrastructure and Security Services (now known as Common Services Security

Program).

IV&V IV&V is the principal activity that oversees the successful implementation and

execution of all internal control processes for financial and interfacing systems.

In order to ensure overall systems integrity, IV&V is accomplished

organizationally independent from the elements that acquire, design, develop or

maintain the system.

KERNEL VistA software that functions as an intermediary between the host operating

> system and other VistA software applications so that VistA software can coexist in a standard operating-system-independent computing environment. Kernel provides

Glossary-10 Master Patient Index/Patient Demographics (MPI/PD) VistA User Manual **April** 1999

Revised August 2011

a standard and consistent user and programmer interface between software applications and the underlying M implementation.

LAN Local Area Network.

LAYGO Access A user's authorization to create a new entry when editing a computer file. (Learn

As You GO allows you the ability to create new file entries.)

**LDAP** Lightweight Directory Access Protocol.

Lookup To find an entry in a file using a value for one of its fields.

Massachusetts General Hospital Utility Multi-Programming System (M, formerly M (ANSI Standard)

named MUMPS) is a software package, which consists of a high level

programming language and a built-in database.

An entry in the MESSAGE file (#3.9). The VistA electronic mail system Mail Message

(MailMan) supports local and remote networking of messages.

Mailman VistA software that provides a mechanism for handling electronic communication,

whether it's user-oriented mail messages, automatic firing of bulletins, or initiation

of server-handled data transmissions.

UCI that can be referenced by non-manager accounts such as production accounts. Manager Account

Like a library, the MGR UCI holds percent routines and globals (e.g., ^%ZOSF)

for shared use by other UCIs.

**Mandatory Field** Field that requires a value. A null response is not valid.

Master Files A set of common reference files used by one or more application systems. These

common reference files need to be synchronized across the various applications at

a given site. The Master Files Notification transactions provide a way of

maintaining this synchronization.

(Austin)

Master Patient Index The MPI is a separate computer system located at the Austin Information

Technology Center. It maintains a record for VA patients and stores data such as a unique patient identifier and Treating Facility lists (which tracks the sites where

that ICN is known).

**Master Patient** Index/Patient **Demographics** (MPI/PD) VistA The Master Patient Index/Patient Demographics (MPI/PD) software resides in VistA enabling sites to:

- Request an ICN assignment.
- Resolve a potential duplicate on the MPI.
- Review and process exceptions received from MPI including Primary View Reject exceptions.
- Query the MPI (Austin) for known data.
- Update the MPI when changes occur to demographic fields stored on the MPI or of interest to other facilities/systems of interest.

Menu

List of choices for computing activity. A menu is a type of option designed to identify a series of items (other options) for presentation to the user for selection. When displayed, menu-type options are preceded by the word "Select" and followed by the word "option" as in Select Menu Management option: (the menu's select prompt).

Menu System

The overall Menu Manager logic as it functions within the Kernel framework.

**Menu Text** 

The descriptive words that appear when a list of option choices is displayed. Specifically, the Menu Text field of the OPTION file (#19). For example, User's Toolbox is the menu text of the XUSERTOOLS option. The option's synonym is TBOX.

**Message Segments** 

Each HL7 message is composed of segments. Segments contain logical groupings of data. Segments may be optional or repeatable. A [ ] indicates the segment is optional, the { } indicates the segment is repeatable. For each message category, there will be a list of HL7 standard segments and/or "Z" segments used for the message.

**MPI Austin** 

The MPI is a separate computer system located at the Austin Information Technology Center. It maintains a record for VA patients and stores data such as a unique patient identifier and Treating Facility lists (which tracks the sites where that ICN is known).

**MPI Initialization** 

The process of initializing a site's PATIENT file (#2) with the Master Patient Index (MPI). Initialization synchronizes PATIENT file (#2) information (for active shared patients) with the MPI and identifies facilities where the patient has been treated. This process transfers the Integration Control Number (ICN), Coordinating Master of Record (CMOR), and Treating Facility list for each patient to the patient's record in the VistA PATIENT file (#2) at all sites where the patient has been treated. It is also possible to initialize an individual patient to the MPI. This is done through menu options. The initial synchronization of PATIENT file (#2) information (for active, shared patients) with the Master Patient Index and with the patient's treating facilities is an important step in the implementation of the MPI/PD software system.

MPI/PD

The Master Patient Index/Patient Demographics (MPI/PD) software resides in VistA enabling sites to:

- Request an ICN assignment.
- Resolve a potential duplicate on the MPI.
- Review and process exceptions received from MPI including Primary View Reject exceptions.
- Query the MPI (Austin) for known data.
- Update the MPI when changes occur to demographic fields stored on the MPI or of interest to other facilities/systems of interest.

Namespace

A convention for naming VistA package elements. The Database Administrator (DBA) assigns unique character strings for package developers to use in naming routines, options, and other package elements so that packages may coexist. The

DBA also assigns a separate range of file numbers to each package.

**Namespacing** Convention for naming VistA software elements. The DBA assigns unique two to

> four character string prefix for software developers to use in naming routines, options, and other software elements so that software can coexist. The DBA also

assigns a separate range of file numbers to each software application.

**NDBI National Database Integration** 

Node In a tree structure, a point at which subordinate items of data originate. An M array

element is characterized by a name and a unique subscript. Thus the terms: node, array element, and subscripted variable are synonymous. In a global array, each node might have specific fields or "pieces" reserved for data attributes such as

name.

Null Empty—A field or variable that has no value associated with it is null.

**Numeric Field** Response that is limited to a restricted number of digits. It can be dollar valued or

a decimal figure of specified precision.

**OED** Office of Enterprise Development

OIT Office of Information Technology

**OIFO** Office of Information Field Office.

**Option** An entry in the OPTION file (#19). As an item on a menu, an option provides an

> opportunity for users to select it, thereby invoking the associated computing activity. Options may also be scheduled to run in the background, non-

interactively, by TaskMan.

**Option Name** Name field in the OPTION file (e.g., XUMAINT for the option that has the menu

text "Menu Management"). Options are namespaced according to VistA

conventions monitored by the DBA.

Package (Software) The set of programs, files, documentation, help prompts, and installation

> procedures required for a given application (e.g., Laboratory, Pharmacy, and PIMS). A VistA software environment is composed of elements specified via the PACKAGE file (#9.4). Elements include files, associated templates, namespaced routines, and namespaced file entries from the OPTION, HELP FRAME, BULLETIN, and FUNCTION files. As public domain software, VistA software

can be requested through the Freedom of Information Act (FOIA).

**PIMS** Patient Information Management System- VistA software package that includes

Registration and Scheduling packages.

Pointer The address at which a data value is stored in computer memory. A relationship

> between two VA FileMan files, a pointer is a file entry that references another file (forward or backward). Pointers can be an efficient means for applications to access data by referring to the storage location at which the data exists.

April 1999 Master Patient Index/Patient Demographics (MPI/PD) VistA User Manual Version 1.0

#### **Primary Key**

A Data Base Management System construct, where one or more fields uniquely define a record (entry) in a file (table). The fields are required to be populated for every record on the file, and are unique, in combination, for every record on the file.

#### **Primary Menu**

The list of options presented at sign-on. Each user must have a primary menu in order to sign-on and reach Menu Manager. Users are given primary menus by Information Resource Management (IRM). This menu should include most of the computing activities the user needs.

#### **Primary Reviewer**

This can be a single person or group of people given the overall responsibility to initiate reviews of potential duplicate record pairs. For example, selected personnel in Patient Administration or a task force or group formed to oversee and conduct the effort of reducing or eliminating the occurrence of duplicate records in the site's database.

#### **Primary View**

Primary View of the MPI is a business process that updates the patient identity fields across VA facilities, overview as follows:

- Primary View is an update to the patient identity fields across VA facilities
- Primary View creates a centralized view of the patient data aka a Primary View
- Primary View has the best data from any combination of sites for the patient
- Synchronizing the patient identity fields becomes centralized under a new set of business rules on the MPI.
- Primary View is a transition from and *disassociated* with the Coordinating Master of Record (CMOR) view of the MPI.
- Primary View removes the burden placed on sites to process the Patient Data Review (PDR) entries.
- Primary View allows for:
  - VistA sites to continue to edit their own patient data.
  - Patient data is sent to a central system (i.e., the Master Patient Index) to determine validity and quality

This is an enterprise view of the most current data for a patient based on authority scoring and the latest data rules. Edits to patient identity traits are evaluated based on the same. The highest score achieves the best quality of data updates to the Primary View.

## Primary View Initialization

Primary View Initialization is a process that occurs on the MPI. This process applies significant enhancements to the MPI business logic to support a more centralized approach to creating and maintaining an Enterprise "Primary View" of the Patient record based on Business Rules instead of CMOR values. "Primary View" is the new centralized Enterprise "View" of a patient on the MPI after the initialization process has been executed, making existing patients on the MPI "Primary View Initialized". Any subsequent records created after "Primary View Initialization" has been run on the MPI will automatically be "Primary View" based.

**Private Integration** Agreement

Where only a single application is granted permission to use an attribute/function of another VistA package. These IAs are granted for special cases, transitional problems between versions, and release coordination. A Private IA is also created by the requesting package based on their examination of the custodian package's features. Example: one package distributes a patch from another package to ensure smooth installation.

**Prompt** 

The computer interacts with the user by issuing questions called prompts, to which the user issues a response.

**Protocol** 

Entry in the PROTOCOL file (#101). Used by the Order Entry/Results Reporting (OE/RR) package to support the ordering of medical tests and other activities.

PS

Product Support, formerly Enterprise Product Support (EPS).

Pseudo-SSNs

False Social Security Numbers that are calculated internally to VistA and cannot be mistaken for valid SSNs because they end in P.

**PSIM** 

VHA's re-hosted Java/Oracle implementation of the MPI's Identity Management Service.

Queuing

Requesting that a job be processed in the background rather than in the foreground within the current session. Jobs are processed sequentially (first-in, first-out). Kernel's TaskMan module handles the queuing of tasks.

**Queuing Required** 

Option attribute that specifies that the option must be processed by Task Manager (the option can only be queued). The option may be invoked and the job prepared for processing, but the output can only be generated during the specified times.

**Receiving Site** 

Receiving Site- As it relates to HL7 Messages, it is the site that the message was sent to.

Record

Set of related data treated as a unit. An entry in a VA FileMan file constitutes a record. A collection of data items that refer to a specific entity (e.g., in a nameaddress-phone number file, each record would contain a collection of data relating to one person).

REEME

Registration/Eligibility/Enrollment Maintenance and Enhancement

**Registration Process** 

During a registration, if a patient does not have an ICN, the patient is checked against the entries in the MPI to determine if the patient already is established or needs to be added. The MPI may return a list of patients who are possible matches. If the patient is truly new and there are no potential matches on the MPI, the MPI will assign an ICN and assigns the requesting site as the CMOR. If the patient is already known at the MPI, the ICN and CMOR is returned and a HL7 message is sent to the CMOR to add this new facility to the list of Treating Facilities for this patient. Registration for patients who already have an ICN at the Facility. At the CMOR site, ADT-A04 Registration HL7 messages are sent to the MPI and the MPI then sends updates to those sites where the patient is known. These messages update the date of last activity and any changes to descriptive data. At a nonCMOR site an ADT-A04 message is sent to the CMOR, via the MPI.

Remote Procedure Call (RPC) Remote Procedure Call is a protocol that one program can use to request a service from a program located on another computer network. Essentially M code may take optional parameters to do some work and then return either a single value or an array back to the client application.

**Requesting Site** 

Requesting Site- As is relates to HL7 Messages, it is the site initiating a message to another site requesting some action be taken.

**Required Field** 

A mandatory field, one that must not be left blank. The prompt for such a field will be repeated until the user enters a valid response.

Reverse Video

The reversal of light and dark in the display of selected characters on a video screen. For example, if text is normally displayed as black letters on a white background, reverse video presents the text as white letters on a black background or vice versa.

RG CIRN DEMOGRAPHIC ISSUES mail group The RG CIRN DEMOGRAPHIC ISSUES bulletin controls the sending of the following patient related bulletin:

- Patient Related Bulletin—REMOTE SENSITIVITY INDICATED
- Cause—Patient is marked as sensitive at the sending site but not at receiving site.
- Action to take—No action: message is informational

**Routine** 

Program or a sequence of instructions called by a program that may have some general or frequent use. M routines are groups of program lines, which are saved, loaded, and called as a single unit via a specific name.

SAC

Standards and Conventions. Through a process of quality assurance, all VistA software is reviewed with respect to SAC guidelines as set forth by the Standards and Conventions Committee (SACC).

**SACC** 

VistA's Standards and Conventions Committee. This Committee is responsible for maintaining the SAC.

**Scheduling Options** 

The technique of requesting that Task Manager run an option at a given time, perhaps with a given rescheduling frequency.

Screen Editor

VA FileMan's Screen-oriented text editor. It can be used to enter data into any WORD-PROCESSING field using full-screen editing instead of line-by-line editing.

ScreenMan Forms

Screen-oriented display of fields, for editing or simply for reading. VA FileMan's Screen Manager is used to create forms that are stored in the FORM file (#.403) and exported with a software application. Forms are composed of blocks (stored in the BLOCK file [#.404]) and can be regular, full screen pages or smaller, "pop-up" pages.

**Screen-Oriented** A computer interface in which you see many lines of data at a time and in which

you can move your cursor around the display screen using screen navigation

commands. Compare to Scrolling Mode.

**Scrolling Mode** The presentation of the interactive dialog one line at a time. Compare to Screen-

oriented.

**SE&I** Software Engineering and Integration

**Security Key** The purpose of Security Keys is to set a layer of protection on the range of

computing capabilities available with a particular software package. The

availability of options is based on the level of system access granted to each user.

**Sending Site** Sending Site—As it relates to HL7 Messages, it is the site that is transmitting the

message to another site.

**Sensitive Patient** Patient whose record contains certain information, which may be deemed sensitive

by a facility, such as political figures, employees, patients with a particular eligibility or medical condition. If a shared patient is flagged as sensitive at one of the treating sites, a bulletin is sent to the DG SENSITIVITY mail group at each subscribing site telling where, when, and by whom the flag was set. Each site can then review whether the circumstances meet the local criteria for sensitivity

flagging.

**SEPG** Software Engineering Process Group (SEPG) (renamed the Engineering Process

Group [EPG])

**Server** The computer where the data and the Business Rules reside. It makes resources

available to client workstations on the network. In VistA, it is an entry in the OPTION file (#19). An automated mail protocol that is activated by sending a message to a server at another location with the "S.server" syntax. A server's activity is specified in the OPTION file (#19) and can be the running of a routine

or the placement of data into a file.

**Set Of Codes** Usually a preset code with one or two characters. The computer may require

capital letters as a response (e.g., M for male and F for female). If anything other

than the acceptable code is entered, the computer rejects the response.

**Shared Patient** Patient who has been seen at more than one site. The CMOR keeps the Treating

Facility list updated every time a new facility where the patient has been seen identifies itself to the MPI. The CMOR then broadcasts, through the MPI, the

updated lists to all the other facilities that share this patient.

**Site Manger/IRM** At each site, the individual who is responsible for managing computer systems,

Chief installing and maintaining new modules, and serving as a liaison to the CIO Field

Offices.

**Software (Package)** The set of programs, files, documentation, help prompts, and installation

procedures required for a given application (e.g., Laboratory, Pharmacy, and PIMS). A VistA software environment is composed of elements specified via the

PACKAGE file (#9.4). Elements include files, associated templates, namespaced routines, and namespaced file entries from the OPTION, HELP FRAME, BULLETIN, and FUNCTION files. As public domain software, VistA software can be requested through the Freedom of Information Act (FOIA).

Spacebar Return

You can answer a VA FileMan prompt by pressing the spacebar and then the Return key. This indicates to VA FileMan that you would like the last response you were working on at that prompt recalled.

**Special Queuing** 

Option attribute indicating that Task Manager should automatically run the option whenever the system reboots.

SSDI

Social Security Death Index (SSDI). The SSDI is a database used for genealogical research as well as enabling users to locate a death certificate, find an obituary, and discover cemetery records and track down probate records. The Healthcare Identity Management (HC IdM) Team uses the SSDI (http://ssdi.rootsweb.com/) as a resource for verifying patients' dates of death.

Subscriber

A subscriber is an entity, which receives updates to a patient's descriptive data from other sites. All treating facilities are also made subscribers as part of the MPI/PD processes.

Subscript

A symbol that is associated with the name of a set to identify a particular subset or element. In M, a numeric or string value that: is enclosed in parentheses, is appended to the name of a local or global variable, and identifies a specific node within an array.

Integration Agreement

**Supported Reference** This applies where any VistA application may use the attributes/functions defined by the IA (these are also called "Public"). An example is an IA that describes a standard API such as DIE or VADPT. The package that creates/maintains the Supported Reference must ensure it is recorded as a Supported Reference in the IA database. There is no need for other VistA packages to request an IA to use these references; they are open to all by default.

Synchronized **Patient Data** 

Key descriptive fields in the PATIENT file (#2) that are updated in all the descriptive subscriber's PATIENT files whenever the fields are edited by a subscriber.

**Systems of Interest** 

The term "systems of interest" refers to VA facilities that have seen patients and entered them as entries onto the MPI. This also refers to non-VistA systems that have a registered interest in a patient (e.g., Federal Health Information Exchange [FHIE], HomeTeleHealth, Person Service Identity Management [PSIM], Health Data Repository [HDR], etc).

Task Manager

Kernel module that schedules and processes background tasks (also called TaskMan)

TCP/IP

Transaction Control Protocol/Internet Protocol. A set of protocols for Layers 3 (Network) and 4 (Transfer) of the OSI network model. TCP/IP has been developed over a period of 15 years under the auspices of the Department of Defense. It is a

Glossary-18

Master Patient Index/Patient Demographics (MPI/PD) VistA User Manual Version 1.0

**April** 1999

de facto standard, particularly as higher-level layers over Ethernet. Although it builds upon the OSI model, TCP/IP is not OSI-compliant.

#### **Template**

Means of storing report formats, data entry formats, and sorted entry sequences. A template is a permanent place to store selected fields for use at a later time. Edit sequences are stored in the INPUT TEMPLATE file (#.402), print specifications are stored in the PRINT TEMPLATE file (#.4), and search or sort specifications are stored in the SORT TEMPLATE file (#.401).

#### Threshold, Auto-Link

The Auto-Link Threshold is the level at which an Identity Profile must score against a set of identity traits in order to be considered a match. For most enterprise applications the Auto-Link Threshold would be set at or near the Initiate-suggested Auto Link Threshold. Internal Identity Management Systems (MPI/PSIM) may use a lower score, perhaps the Task Threshold, as an Auto-Link Threshold for identity management decision processes.

#### Threshold, Task

The Task Threshold (also called the Clerical Review Threshold) is a value that is less than the Auto-Link Threshold. A Comparison Score above the Task Threshold and below the Auto-Link Threshold needs to be reviewed by an Identity Management expert to determine whether the Identity Profile is either a match or not a match for the traits being compared. The Task Threshold is determined and tuned by Identity Management experts and may change over time as software systems and business processes improve. The ideal goal for automated identity matching is to minimize the difference between the Task Threshold and the Auto-Link Threshold.

#### **Treating Facility**

Any facility (VAMC) where a patient has applied for care, or has been added to the local PATIENT file (#2) (regardless of VISN) and has identified this patient to the MPI will be placed in the TREATING FACILITY LIST file (#391.91).

#### **Treating Facility** List

Table of institutions at which the patient has received care. This list is used to create subscriptions for the delivery of patient clinical and demographic information between sites.

#### Trigger

A type of VA FileMan cross-reference. Often used to update values in the database given certain conditions (as specified in the trigger logic). For example, whenever an entry is made in a file, a trigger could automatically enter the current date into another field holding the creation date.

#### **Trigger Event**

The event that initiates an exchange of messages is called a trigger event. The HL7 Standard is written from the assumption that an event in the real world of health care creates the need for data to flow among systems. The real-world event is called the trigger event. For example, the trigger event "a patient is admitted" may cause the need for data about that patient to be sent to a number of other systems. There is a one-to-many relationship between message types and trigger event codes. The same trigger event code may not be associated with more than one message type.

#### UCI

User Class Identification, a computing area. The MGR UCI is typically the Manager's account, while VAH or ROU may be Production accounts.

April 1999 Master Patient Index/Patient Demographics (MPI/PD) VistA User Manual Revised August 2011

User Access

This term is used to refer to a limited level of access, to a computer system, which is sufficient for using/operating a package, but does not allow programming, modification to data dictionaries, or other operations that require programmer access. Any option, for example, can be locked with the key XUPROGMODE, which means that invoking that option requires programmer access.

The user's access level determines the degree of computer use and the types of computer programs available. The System Manager assigns the user an access level.

VA

Department of Veterans Affairs

VA FileMan

VistA's Database Management System (DBMS). The central component that defines the way standard VistA files are structured and manipulated.

**VAMC** 

Veterans Affairs Medical Center.

Variable

Character, or group of characters, that refer(s) to a value. M (previously referred to as MUMPS) recognizes 3 types of variables: local variables, global variables, and special variables. Local variables exist in a partition of main memory and disappear at sign-off. A global variable is stored on disk, potentially available to any user. Global variables usually exist as parts of global arrays. The term "global" may refer either to a global variable or a global array. A special variable is defined by systems operations (e.g., \$TEST).

**VBA IBBA** 

VBA Intranet BDN / BIRLS Access (IBBA). This VBA application is designed for Web browser access to veteran information data bases (Currently, Benefits Delivery Network (BDN) and Beneficiary Identification and Resource Locator System (BIRLS) and the Vocational Rehabilitation and Employment master record for an eligibility indicator link). The HC IdM Team uses VBA-IBBA as a resource for verifying patient identity data as well as military information.

VBA SHARE

This is a VBA application which is utilized by the Regional Offices to access BIRLS, C&P, PIF, PHF, Corporate Database, Social Security and COVERS records. The Healthcare Identity Management (HC IdM) Team uses VBA SHARE as a resource for verifying patient identity data as well as military information.

Verify Code

The Kernel's Sign-on/Security system uses the Verify code to validate the user's identity. This is an additional security precaution used in conjunction with the Access code. Verify codes shall be at least eight characters in length and contain three of the following four kinds of characters: letters (lower- and uppercase), numbers, and, characters that are neither letters nor numbers (e.g., "#", "@" or "\$"). If entered incorrectly, the system does not allow the user to access the computer. To protect the user, both codes are invisible on the terminal screen.

**VHA** 

Veterans Health Administration.

VIS

Veterans Information Solution (VIS). This intranet-based application is designed to provide a consolidated view of information about veterans and active service members. The HC IdM Team uses VIS as a resource for verifying patient identity

data as well as military information.

VISN Veterans Integrated Service Network

VistA Veterans Health Information Systems and Technology Architecture (VistA) of the

Veterans Health Administration (VHA), Department of Veterans Affairs (VA).

VistA software, developed by the VA, is used to support clinical and

administrative functions at VHA sites nationwide. It is both roll-and-scroll- and GUI-based software that undergoes a quality assurance process to ensure conformity with namespacing and other VistA standards and conventions (see

SAC).

Server-side code is written in M, and, via Kernel, runs on all major M implementations regardless of vendor. Client-side code is written in Java or

Borland Delphi and runs on the Microsoft operating system.

**VPID** Veterans Administration Personal Identifier.

**WAN** Wide Area Network.

**Z st** All message type and trigger event codes beginning with Z are reserved for

locally defined messages. No such codes will be defined within the HL7

Standard.

Table G-1: Glossary

## Appendix A: VHA DIRECTIVE 2006-036

**Department of Veterans Affairs Veterans Health Administration** Washington, DC 20420

VHA DIRECTIVE 2006-036

June 1, 2006

#### DATA QUALITY REQUIREMENTS FOR IDENTITY MANAGEMENT AND MASTER PATIENT INDEX FUNCTIONS

1. **PURPOSE:** This Veterans Health Administration (VHA) Directive defines data quality requirements for support of Identity Management and the Master Patient Index (MPI) operations at VHA medical facilities.

#### 2. BACKGROUND

- a. Accurate and complete person-identifying information is critical to VHA in the areas of patient care, management reporting, resource allocation, corporate forecasting, and for other business and clinical needs. The amount of patient and other person information now stored electronically in VHA databases has increased and become more complex. This information is widely distributed, residing at each of the VHA health care facilities, as well as in corporate (Austin Corporate Franchise Datacenter [CFD] and other) databases.
- b. Catastrophic edits to identity are defined as those that change the original patient record in a local Veterans Health Information Systems and Technology Architecture (VistA) system to that of another patient by inappropriately editing that existing record through misselection (error).
- (1) These errors can also occur as a result of improper due diligence by staff using the duplicate record merge tool when two potential duplicate patient records are not properly reviewed and screened. This results in two different patient entries being merged into one.
- (2) All types of errors affect the patient entry (record) at other facilities that have treated the patient and they specifically affect patient care. These errors are considered a significant patient safety risk.
- c. Administrative, clinical, billing, and interdepartmental processes within the Department of Veterans Affairs (VA), such as eligibility data sharing between the Veterans Benefits Administration (VBA) and VHA, depend on accurate person information and identity management. Accuracy of person information and identity management has a direct impact on patient safety and the provision of health care.
- d. In order to ensure that individuals are correctly identified by the staff during patient selection and entry and to prevent catastrophic edits to identity, extreme care must be exercised when entering and editing identity information.

#### VHA DIRECTIVE 2006-036 June 1, 2006

**3. POLICY:** It is VHA policy that databases, including the MPI, maintain accurate and complete person-identifying information, and that vital processes related to resolving identity data quality issues be performed.

#### THIS VHA DIRECTIVE EXPIRES JUNE 30, 2011

#### 4. ACTION

- a. **Facility Directors.** Each facility Director is responsible for:
- (1) Ensuring that the entry of person identity data into the VistA applications is accurate and complete.
- (2) Designating individuals as points-of-contact (POCs) responsible for processing Exception Handling and Patient Data Review cases, and resolving Integration Control Number (ICN) issues and exceptions in VistA on a daily basis, as well as resolving any other data quality issues brought to their attention by the national Identity Management Data Quality (IMDQ).
- (3) Ensuring that personnel are assigned to resolve, in a timely manner, issues with exceptions, patient data reviews, data quality issues, communication links, infrastructure, and applications that support data communications. This includes assigning staff members to the following roles (including alternates for each of these categories):
  - (a) Administrative POC,
  - (b) Information Resource Management (IRM) POC, and
  - (c) Health Level 7 (HL7) POC.

**NOTE:** POC information for Master Patient Index/Patient Demographics (MPI/PD) is updated using the Add/Edit Point-of-Contact [RG UPDATE POINT OF CONTACT] option on the MPI/PD Patient Admin Coordinator Menu [RG ADMIN COORD MENU].

- (4) Ensuring that national IMDQ staff are apprised of staffing changes.
- (5) Ensuring that potential catastrophic edits are reviewed and resolved, if necessary, in a timely and accurate manner.
- (6) Ensuring that management and staff are made aware of policies and procedures related to catastrophic edits to patient identity. This includes ensuring that staff members involved in the entry, editing, and merging of patient records receive certification for the mandatory training.

**NOTE:** The mandatory training, "Preventing Catastrophic Edits to Patient Identity," can be found at the following VistA University website: http://vaww.vistau.med.va.gov/vistau/PCEI

#### VHA DIRECTIVE 2006-036 June 1, 2006

- (7) Ensuring that staff directly involved with identity data entry into information systems are aware of the guidelines contained within this Directive and are aware of their responsibility for entering complete identity data elements in a consistent and accurate format. This also includes staff at facilities with outpatient clinics and community-based outpatient clinics assigned to their jurisdiction.
- (8) Ensuring that each supervisor involved in the activities of entering demographic data follows the guidance on data quality of the non-identity elements provided by the VHA Chief Business Office (CBO).
- (9) Ensuring that staff members responsible for data entry of administrative and demographic information are informed of these requirements mandated by the CBO. NOTE: Links to up-to-date guidance on data quality are posted on the IMDQ team's Web site at http://vista.med.va.gov/mpi\_dqmt/

#### **b. Facility Administrative POCs.** Each facility MPI POC is responsible for:

- (1) Working with their counterparts, national IMDQ staff, and other Office of Information (OI) personnel in correcting anomalies and addressing issues related to identity data for shared patients.
- (2) Processing Exception Handling and Patient Data Review cases in VistA to ensure accuracy and completeness of identity data.
- (3) Taking appropriate action to resolve exceptions and patient data review cases within 5 business days. NOTE: Specific information regarding these processes can be found in Attachment A.
  - (4) Reviewing potential duplicate patients on the MPI within 2 business days
  - (5) Using electronic mail, i.e., FORUM and Outlook, to facilitate communications.
  - (6) Ensuring that contact information maintained by the IMDQ team is current.
  - (7) Obtaining the necessary VistA access to verify information.
- (8) Making appropriate changes to patient data in respective facility's VistA system and perform POC functions, such as processing Exception Handling and Patient Data Review cases.

#### c. Facility IRM and HL7 POCs. Facility IRM and HL7 POCs are responsible for:

(1) Working with their counterparts and Enterprise Product Support (EPS) staff to maintain communication links, infrastructure, and applications supporting data communications; and

#### VHA DIRECTIVE 2006-036 June 1, 2006

- (2) Resolving data quality issues.
- (a) In general, responses to inquiries and requests for assistance to resolve data quality issues must be completed within 5 business days.
- (b) Requests from the IMDQ team to resolve catastrophic edits that overwrite original patient entry with another patient must be completed within 1 business day.

#### 5. REFERENCES

- a. M-1, Part I, Chapter 4.
- b. M-1, Part I, Chapter 16.
- **6. FOLLOW-UP RESPONSIBILITY:** The Director, Health Data and Informatics (HDI) (19F) is responsible for the content of this Directive. Questions may be referred to the Identity Management Team Lead at (205) 554-3449.
- **7. RESCISSIONS:** None. This VHA Directive expires June 30, 2011.

#### Jonathan B. Perlin, MD, PhD, MSHA, FACP Under Secretary for Health

#### ATTACHMENT A

### GUIDELINES FOR DATA ENTRY AND MAINTENANCE RELATED TO IDENTITY MANAGEMENT

It is imperative that staff take the utmost care when entering identity data for patients and other persons. Incomplete or inaccurate data (including typographical errors) are the leading cause of duplicate entries in the Master Patient Index (MPI) and the failure to link records via the Integration Control Number (ICN). The following guidelines are intended to increase the accuracy and completeness of the essential identity data elements and to clarify practices that need to be followed when data is not available or duplicate entries exist. These guidelines emphasize the intended use of some identity fields within the Veterans Health Information Systems and Technology Architecture (VistA). It is important that identity data for patients: be reviewed for accuracy and completeness; and updated, as necessary, each and every time contact is made with the individual.

- **1. NAME:** The NAME field is an important element in the unique identity of a person. Sites need to ensure that the name entered is the complete legal proper name, and includes a full middle name, when available. Avoid using nicknames or ambiguous information. Additional guidance for the entry of the name field includes the following procedures:
  - a. All data must be entered using uppercase letters.
  - b. No parenthesis may be used.
  - c. Commas, apostrophes, and hyphens are the only punctuation that may be used.
- d. Enter full middle names. Do not use only an initial unless an initial is the person's given middle name. The middle name will be left blank if one does not exist; NMI (no middle initial) or NMN (no middle name) will not be used.
- e. Multiple last name components must be separated by spaces. People with hyphenated names are to be entered with the hyphen included.
- f. When entering a full name, it must contain a comma (i.e., Last Name, First Name). Individuals with a legal name as a single value must be entered with the name followed by a comma.
- g. Suffixes must be used for junior (JR), senior (SR) and birth positions. Numeric birth position identifiers must be entered in Roman numeral values (i.e., I, II, III, etc.). Suffixes must be entered without punctuation.

- h. If entering a Prefix, (such as MR, MRS, MS, and MISS), no punctuation must be used.
- i. The Degree field may be used to denote the degree or profession (such as MD, PHD, REV), and must be entered without punctuation.

### VHA DIRECTIVE 2006-036 June 1, 2006

- j. Legal Spanish names must be entered with the mother's maiden name first, a hyphen and the father's name all in the LAST NAME field.
- k. Alias names must be entered in the ALIAS NAME field for any previously used names (including maiden names). An entry in this field must be automatically cross-referenced and the record can be accessed using the alias name.
- l. To enter another entry with the same name as an existing person in the file on VistA, use quotes when entering the full name and a new entry will be created (i.e,. "ZZTEST,FIRSTNAME MIDDLE").
- m. TEST patient records must be designated by the last name being prefixed by ZZ, i.e. ZZLASTNAME, FIRSTNAME MIDDLE.
- n. Official documentation must be required for a name change. Official documentation is defined as court documents or Social Security card. If an individual state's procedures for driver's license application, or similar documents, meet the standard for official documentation, VHA staff should accept such documents as proof of a legal name change.
- **2. SOCIAL SECURITY NUMBER (SSN):** Official SSNs issued by the Social Security Administration are the only values entered into this field. If a valid SSN is not known, then a "P" must be entered into the field for the calculation of a pseudo SSN only for patients. SSNs are not to be created and no other numbers may be entered in this field, including prisonissued numbers or Canadian SSNs. SSNs beginning with five leading zeros are considered TEST patients and are not be used for any other purpose.
- **3. MOTHER'S MAIDEN NAME:** Enter the last name only of individual's mother at the time of her birth. Leave blank if unknown or not provided. Values such as "deceased," "unknown," and other inappropriate responses are not to be used.
- **4. GENDER:** Male or Female must be entered. In case of gender reassignment, legal documentation (amended birth certificate, court documents, etc.) must be required as proof of a legal gender change.
- **5. DATE OF BIRTH:** Day, Month, and Year of Birth must be entered, whenever available. Imprecise (month/year or year only) can be entered, but only if the full Date of Birth is not available.

- **6.** PLACE OF BIRTH [CITY]: Enter the birth city only. For persons born outside of the United States, enter the city, province, or other designated area.
- 7. PLACE OF BIRTH [STATE]: Enter the birth state only. For persons born outside the United States, choose FOREIGN COUNTRY from the list of state options.
- **8. PLACE OF BIRTH [COUNTRY]** (not yet available): Enter the birth country only (future implementation in VistA). The default country must be the UNITED STATES.
- 9. MULTIPLE BIRTH INDICATOR (Patients only): Enter YES in the Multiple Birth Indicator field only if the patient is part of a multiple birth (i.e., is a twin, triplet, etc.). This field assists in the unique identification of patients who are part of a multiple birth and may have identity traits similar to other patient entries.
- 10. DATES OF DEATH (Patients only): Death certificates are generally required to enter a Date of Death. Dates of Death must not be entered from newspaper obituaries, phone calls, or other unofficial sources. Information from these sources may be used as a mechanism to further research the death information. However, they must not be entered unless they have been verified by an official source. Medical facilities are required to use the following as authoritative sources in order of precedence:
- a. Veterans Health Administration (VHA) facility is an authoritative source for date of death if the person died in the VHA facility or while under VA auspices.
  - b. Social Security Administration.
  - c. Department of Vital Statistics.
  - d. Death Certificate.
- e. National Cemetery Administration (NCA) is an authoritative source for the date of death if the veteran has received NCA benefits.
- f. Veterans Benefit Administration (VBA) is an authoritative source if veteran received monetary benefits.
- 11. MOTHER'S NAME and FATHER'S NAME (patients only): The patient's mother's and father's complete legal names need to be entered in the appropriate fields, when known. Values such as "deceased," "unknown," and other inappropriate responses are not be used.
- 12. INCAPACITATED OR UNRESPONSIVE PATIENTS (for whatever reason): Records for incapacitated patients must be entered with a pseudo SSN, 1900 for the Date of Birth, and name entered as UU-UNRESPONSIVE, PATIENT. Subsequent patient records must be entered as UU-UNRESPONSIVE, PATIENT A, UU-UNRESPONSIVE, PATIENT B, etc. Records must be completed with appropriate identity data elements once the patient has been identified.

- **13, TEST PATIENTS:** It is essential that TEST patients who exist in local VistA production systems be designated with a SSN containing five leading zeros (i.e., 000001111) and the last name prefixed by ZZ (i.e., ZZTESTPATIENT, FIRSTNAME MIDDLE). Test entries should not be used for categories of persons outside of patients, or for patients that are other than those used exclusively for testing purposes.
- **14. RESEARCH PATIENTS:** Research patients must have all valid information (i.e., legal name, real SSN, etc.) collected and entered.
- 15. SSN, DATE OF BIRTH, MOTHER'S MAIDEN NAME, PLACE OF BIRTH [CITY], PLACE OF BIRTH [STATE] and PLACE OF BIRTH [COUNTRY]: The SSN, DATE OF BIRTH, MOTHER'S MAIDEN NAME, PLACE OF BIRTH [CITY], PLACE OF BIRTH [STATE] and PLACE OF BIRTH [COUNTRY] identity data fields important in the unique identification of individuals, since these are fields that do not generally change over time. If these fields are inaccurate or incomplete, it is difficult to ensure that duplicates are not being created and that the record is being linked to the correct Integration Control Number (ICN) on the MPI.
- 16. PATIENT RECORDS INVOLVED IN IDENTITY THEFT: Records for a patient that is determined to be an "imposter," where staff are unable to obtain the true identity of a patient, need to be edited to reflect the NAME field of THEFT, IDENTITY A (where the trailing letter would be incremented for each subsequent entry that exists in the local VistA PATIENT file). The record needs to be edited to use a pseudo SSN and have the Date of Birth recorded as 1900. Identity theft must be reported through VA Police and Security and the appropriate Regional Counsel. Any electronic documentation that is determined not to belong to the real patient (if identified) must be retracted in the same manner that any document found to be erroneously attributed to a patient is removed.
- **17. ALIAS FIELDS:** The ALIAS fields are only to be used to enter previously-used names and SSNs, or names and SSNs that may be used at other treating facilities; these assist in recognizing potential duplicate entries. Name changes due to marriage, divorce, etc., need to be entered into the ALIAS field as well.
- **18. MPI EXCEPTIONS IN VISTA:** When processing MPI exceptions in VistA, if potential duplicates are identified while matching the individual to the MPI, the record is not to be matched with any of the entries, but a request for assistance with duplicate resolution needs to be sent via an e-mail message to the MPIF EXCEPTIONS mail group on VistA or VHA OI IA MPI DQ TEAM distribution group on Outlook with a password-protected Word document containing sensitive information. A request for national support can also be entered via the OI national problem management system (Remedy). This helps identify potential duplicates and resolve them with as minimal impact to data as possible. When submitting requests for assistance via Remedy, do not include the individual's identifying information (Name, SSN, etc.). The specialist assigned to the request must obtain this information directly from the Point-of-Contact (POC).

**19. DUPLICATE PATIENT ENTRIES:** To resolve local duplicate patient entries in VistA and to merge the data from one record to the other, use the process outlined in the DUPLICATE RECORD MERGE: Patient Merge User Manual located at the following website:

http://www.va.gov/vdl/VistA\_Lib/Infrastructure/Dupl\_Rec\_Merge/xt\_73\_p23\_um.doc

- **20. ADDITIONAL INFORMATION:** Additional information can be found on the Identity Management Data Quality website at http://vista.med.va.gov/mpi\_dqmt/. Extreme caution must be taken when merging duplicate records to ensure the records are for the same individual. Many identity fields for individuals of multiple birth (i.e., twins) will be the same or similar. Once patients are identified as part of a multiple birth, the Multiple Birth Indicator needs to be set to "Yes" on all applicable records. It is essential that appropriate clinical ancillary staff review potential duplicate records, to verify whether or not they should be merged.
- **21. THE PATIENT DATA REVIEW PROCESS AND LOCAL EXCEPTIONS:** The Patient Data Review process and Local Exceptions processing must be performed on a daily basis, to ensure that inconsistencies are addressed in a timely manner. Failure to resolve data quality issues may result in incorrect operation of the Remote Data View-VistA Web and Inter-facility Consults functions for facility clinicians.
- a. In addition, various Health<u>e</u>Vet applications require data quality issues to be resolved before implementation can be completed. National reporting of data quality issues may be performed, as necessary, to facilitate timely resolution of such issues.
  - b. Further information on these functions can be found in the following manuals:
- (1) The Exception Handling instruction document can be found at the following website: http://www.va.gov/vdl/VistA\_Lib/Infrastructure/Master\_Patient\_Index\_(MPI)/RG1\_0\_EH.doc
- (2) The Patient Data Review Process can be found in Appendix C at the following website: http://www.va.gov/vdl/VistA\_Lib/Infrastructure/Master\_Patient\_Index\_(MPI)/RG1\_0\_UM.doc
- c. Additional information regarding the Identity Management Data Quality team and its role, along with a current listing of the national team and the VHA facility Points-of-Contact can be found on the Identity Management Data Quality website at <a href="http://vista.med.va.gov/mpi\_dqmt/">http://vista.med.va.gov/mpi\_dqmt/</a>.

Appendix A: VHA DIRECTIVE 2006-036

## Appendix B: MPI Glossary of Working Concepts

## DUPLICATE Not same ICN

More than one patient in a single PATIENT file (#2) cannot have the same PATIENTS IN VistA Integration Control Number (ICN), This is a business rule established by Healthcare Identity Management (HC IdM). If there is a site duplicate discovered, each patient will have their own unique ICN and a Potential Match Exception will be generated for HC IdM team to review. If HC IdM determines the record to be a duplicate, they will link the ICNs together and push down the entry to the Duplicate Record file in that VistA instance for processing via the Duplicate Record Merge application.

INSTITUTION FILE A site can be in only one VISN at a time. A record in the INSTITUTION file (#4) cannot have two parents of the same type. A record in the INSTITUTION file (#4) cannot be a child and have children of its own.

#### MPI (AUSTIN)

The Master Patient Index (MPI) is located at the Austin Information Technology Center (AITC). It is composed of a unique list of patients and an associated list of VAMCs (Veterans Affairs Medical Centers) and other systems of interest where each patient has been seen. This enables the sharing of patient data between operationally diverse systems. Each patient record (or index entry) on the MPI contains multiple demographic fields which are updated to the Primary View of the MPI.

**NOTE:** For a list of the fields stored on the MPI, see the section titled: "Appendix D: Data Stored on the MPI in Austin" in this documentation.

#### **PATIENT SENSITIVITY**

If a shared patient is flagged as sensitive at one of the treating sites, a bulletin is sent to the RG CIRN DEMOGRAPHIC ISSUES mail group at each subscribing site telling where, when, and by whom the flag was set. Each site can then review whether the circumstances meet the local criteria for sensitivity flagging. If the site chooses to change the patient to a sensitive status, the option to do so would be used and then a bulletin would be sent to the mail group established in the PIMS package for notifying users of a sensitive patient change.

### **CORRELATIONS** (Formally referred to as Treating Facilities)

Systems that know a specific Integration Control Number (ICN) and have registered an interest in that ICN.

### POTENTIAL **IDENTITY CHANGE**

If two or more of the following fields are different than what is currently stored on the MPI (i.e., Name [first or last name only - only count as 1], SSN, DOB or Sex), there is no further broadcasting of the update anywhere. If the patient is shared, only that site's Treating Facility entry in the MPI VETERAN/CLIENT file, in Field #985.5, is updated and an exception is logged on the MPI Exception Handler noting that a potential identity change has occurred. If the patient is NOT SHARED, then both the MPI VETERAN/CLIENT file (#985) and the Treating Facility entry (#985.5) is updated and an exception is logged to the MPI Exception Handler noting a potential identity change has occurred.

UPDATE MESSAGES

Descriptive data update messages are broadcast by the MPI Austin.

Table B-1: MPI Glossary of Working Concepts

## Appendix C: Exceptions and Bulletins

NOTE: For information on exception messages, their resolution, and the MPI/PD Exception Handling option [RG EXCEPTION HANDLING] introduced in Patch RG\*1\*3, see the Master Patient Index/Patient Demographics (MPI/PD) VistA Exception Handling manual at the following web site:

http://www.va.gov/vdl/Infrastructure.asp?appID=16

This document gives Master Patient Index/Patient Demographics (MPI/PD) sites information and assistance in dealing with exception messages.

Appendix C: Exceptions and Bulletins

# Appendix D: Data Stored on the MPI in Austin

The following is a list of the fields stored on the MPI in Austin:

Name and Number	Description	
INTEGRATION CONTROL NUMBER (ICN) (#.01)	Based on ASTM E-1714 format is 16 digits, delimiter character, 6 checksum digits.	
SURNAME (#1)	Family name, also known as last name.	
FIRST NAME (#2)	Patient's first given name.	
MIDDLE NAME (#3)	Patient's middle name or middle initial.	
NAME PREFIX (#4)	Commonly, Dr., Ms., Sir., or other appropriate titles.  NOTE: Not currently populated on the MPI.	
NAME SUFFIX (#5)	Examples are Jr., Sr., PhD, etc.	
MOTHERS MAIDEN NAME (#6)	Mother's Surname at her birth.	
DATE OF BIRTH (#7)	Date of patient's birth.	
PLACE OF BIRTH CITY (#8)	Name of the city or town (or nearest) where the patient was born.  NOTE: Not synchronized to the systems of interest.	
PLACE OF BIRTH STATE (#9)	If USA, 2 character state abbreviation. If not USA, the country state. Pointer to the STATE file (#5).  NOTE: Not synchronized to the systems of interest.	
DATE OF DEATH (#10)	The date of the person's death.  NOTE: Not part of the Primary View.	
DEATH VERIFICATION STATUS (#11)	One of four criteria must exist to flag this as Verified:  Patient death under VA auspices  DoD casualty report  Receipt of certified death certificate  Burial benefits by NCS	
GENDER (#12)	<ul><li>M = MALE</li><li>F = FEMALE</li></ul>	
SOCIAL SECURITY NUMBER (#13)	Patient's Social Security Number (SSN) NOTE: Pseudo SSNs aren't stored on the MPI.	
SSN VERIFICATION STATUS (#14) NOTE: Added to File #985 as of Patch MPI*1*40. Populated to the Primary View of the MPI and systems of	Status of the verification of a patient's SSN. This value is stored on the MPI, derived from an update from the ESR application after interaction with SSA (Social Security Administration). Possible values synchronized to sites are:  • Null  • INVALID PER SSA  • VERIFIED	

Name and Number	Description	
interest to the MPI as of DG*5.3*688 [EVC R2].	Possible values used on the MPI for the ESR correlation are:  NEW RECORD  IN-PROCESS  INVALID PER SSA  RESEND TO SSA  VERIFIED	
PSEUDO SSN REASON (#14.1)  NOTE: Added to File #985 as of Patch MPI*1*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of RG*1*47 and DG*5.3*653 [EVC R1].)	Used to document the reason an individual was assigned a pseudo SSN. Available reasons are:  • (R) Refused to Provide—Individual was asked for his/her SSN but refused to provide the number.  • (S) SSN Unknown/Follow-up required—Individual is not available to ask/answer the request for SSN. The facility should initiate follow-up activity to obtain the SSN.  • (N) No SSN Assigned—Individual has not been assigned an SSN. This generally applies to spouse or dependents of veterans who are not US citizens, and infrequently, non-citizen beneficiaries.	
CLAIM NUMBER (#15)	VBA assigned claim number. Used to assist confirming ID. NOTE: Not part of the Primary View.	
COORDINATING MASTER OF RECORD (#16)	Pre-Primary View Coordinating Site for patient. POINTER TO INSTITUTION file (#4).	
PRIMARY ICN (#18)	As of patch MPI*1.0*40, this field will be used as the value of the Primary ICN for a deactivated ICN. The field will only be populated for an entry that has an ID STATE of deactivated. It is basically telling which ICN should be used instead.	
DATE/TIME OF ORIGINAL CREATION (#19)	Date/time that the patient was added to the MPI VETERAN/CLIENT (#985) file. This information will be used for reports and analysis by the MPI Data Quality Management team.	
FACILITY OF ORIGINAL CREATION (#20)	Facility that originally added the patient to the MPI VETERAN/CLIENT (#985) file. This information will be used for reports and analysis by the MPI Data Quality Management team.	
CREATED BY (#21)	The CREATED BY field identifies the person at the FACILITY OF ORIGINAL CREATION who added the patient to the MPI VETERAN/CLIENT (#985) file. This information will be used for reports and analysis by the MPI Data Quality Management team.	
RESOLUTION JOURNAL CASE NUMBER (#22)	If a case exists in the MPI DATA MGT RESOLUTION JOURNAL file (#985.2) for this ICN it will be stored in this field regardless of the status of the case. Resolution Journal cases hold the history of any resolution work done by the Data Quality Team on this ICN.	
PRIMARY VIEW DATE LAST UPDATED (#23)	The PRIMARY VIEW DATE LAST UPDATED field is the date/time that any of the patient's identity element fields were last updated in the MPI VETERAN/CLIENT (#985) file.	
MARITAL STATUS (#30)	Patient's current marital status.  NOTE: Not part of the Primary View.	

Name and Number	Description	
STREET ADDRESS [LINE 1] (#31)	First line of patient's residence street address (3-35 characters).  NOTE: Not part of the Primary View.	
STREET ADDRESS [LINE 2] (32#)	Second line of patient's residence street address (3-30 characters) if the space provided in "street address" was not sufficient.  NOTE: Not part of the Primary View.	
STREET ADDRESS [LINE 3] (33#)	Third line of patient's residence street address (3-30 characters) if the space provided in "street address" and "street address 2" was not sufficient.  NOTE: Not part of the Primary View.	
CITY [RESIDENCE] (#34)	City in which patient resides (3-28 characters).  NOTE: Not part of the Primary View.	
STATE [RESIDENCE] (#35)	State in which patient resides.  NOTE: Not part of the Primary View.	
ZIP+4 [RESIDENCE] (#36)	Five or Nine digit Zip Code.  NOTE: Not part of the Primary View.	
PHONE NUMBER [RESIDENCE] (#37)	Telephone number (4-23 characters) to patient's place of residence.  NOTE: Not part of the Primary View.	
POW STATUS INDICATED? (#38)	"Y" if s/he was confined as a prisoner of war, "N" if not, or "U" if unknown.  NOTE: Not part of the Primary View.	
MULTIPLE BIRTH INDICATOR (#39) NOTE: Added to the list	The MULTIPLE BIRTH INDICATOR will designate whether or not the patient is part of a multiple birth (i.e. to identify twins, etc.). Possible values are:  • N = NO	
of fields auto-updated in VistA as of Patch RG*1*47.	<ul> <li>N = NO</li> <li>Y = MULTIPLE BIRTH</li> <li>Null (not the same as No)</li> </ul>	
ALIAS SURNAME (#02,.01)	Patient's last name (a.k.a family name). If this patient is known by any name other than that entered in the Name field, enter the other name(s) here.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.	
ALIAS FIRST NAME (#.02,1)	Patient's first name.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.	
ALIAS MIDDLE NAME (#.02,2)	Patient's middle name or middle initial.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.	
ALIAS PREFIX (#.02,3)	Commonly, Dr., Ms., Sir, or other appropriate titles.  NOTE: Not currently populated on the MPI. Once in Primary View, will be an aggregated list from all treating facilities.	
ALIAS SUFFIX (#.02,4)	Examples are Jr., Sr., PhD, etc.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.	
ALIAS SSN (#.02,5)	If the patient was also known under a name other than that listed in the	

Name and Number	Description	
	NAME field of the PATIENT file (#2), enter the social security number used if different when the patient used this alias.	
	NOTE: Alias SSNs that are Pseudo SSNs will not be stored on the MPI. Alias SSN is paired with an Alias Name. There can't be just an alias SSN. Once in Primary View, will be an aggregated list from all treating facilities.	
ALIAS DATE LAST UPDATED (#.02,6)	The ALIAS DATE LAST UPDATED field is the date/time that the ALIAS field was last updated in the MPI VETERAN/CLIENT (#985) file.	
RACE INFORMATION (#60)	Enter the race that best identifies this patient.  NOTE: Not synchronized to the systems of interest. Once in Primary View, will be an aggregated list from all treating facilities.	
ETHNICITY INFORMATION (#70)	Enter the ethnicity that best identifies this patient.  NOTE: Not synchronized to the systems of interest. Once in Primary View, will be an aggregated list from all treating facilities.	
ID STATE (#80)	The following ID STATE definitions are from the Object Management Group (OMG) Person Identification Service (PIDS) Specification. ID STATE designates the status of the entry in the MPI VETERAN/CLIENT (#985) file in accordance with business rules and standards. Values for the patient are:	
	P = Permanent	
	T = Temporary  P    Denoticated	
	D = Deactivated  PERMANENT: This ID State specifies that all required fields are entered and a national ICN is established. When an ID is created as permanent all mandatory traits <i>must</i> be provided. A permanent ID can be deactivated but <i>cannot</i> be made temporary.	
	TEMPORARY: This ID State specifies that there are not enough fields to make an entry permanent (as defined further in the business rules). An ID can be created as temporary without indicating any mandatory traits. A common usage is to create an ID that data can be bound to a patient before that patient is identified with an appropriate confidence. A temporary ID can be made permanent or deactivated.	
	DEACTIVATED: This ID State specifies that the ICN is no longer used. Once an ID is expected not to be needed any more it can be deactivated (merged or deprecated), which keeps it around for historical purposes. A deactivated ID is in its final state and <i>cannot</i> be transitioned to any other state by PIDS operations, except unmerging.  NOTE: Not synchronized to the systems of interest.	
DATE OF ID STATE (#81)	The DATE OF ID STATE field identifies when the ID STATE field was last updated.	
SURNAME PRIMARY VIEW SCORE (#85)	The SURNAME PRIMARY VIEW SCORE field contains the Primary View Authority Score for the SURNAME (#1) identity element.	
FIRST NAME PRIMARY VIEW SCORE (#86)	The FIRST NAME PRIMARY VIEW SCORE field contains the Primary View Authority Score for the FIRST NAME (#2) identity element.	
MIDDLE NAME PRIMARY VIEW SCORE (#87)	The MIDDLE NAME PRIMARY VIEW SCORE field contains the Primary View Authority Score for the MIDDLE NAME (#3) identity element.	

Name and Number	Description
PREFIX PRIMARY VIEW SCORE (#88)	The PREFIX PRIMARY VIEW SCORE field contains the Primary View Authority Score for the NAME PREFIX (#4) identity element.
SUFFIX PRIMARY VIEW SCORE (#89)	The SUFFIX PRIMARY VIEW SCORE field contains the Primary View Authority Score for the NAME SUFFIX (#5) identity element
DOB PRIMARY VIEW SCORE (#90)	The DOB PRIMARY VIEW SCORE field contains the Primary View Authority Score for the DATE OF BIRTH (#7) identity element.
GENDER PRIMARY VIEW SCORE (#91)	The GENDER PRIMARY VIEW SCORE field contains the Primary View Authority Score for the GENDER (#12) identity element.
SSN PRIMARY VIEW SCORE (#92)	The SSN PRIMARY VIEW SCORE field contains the Primary View Authority Score for the SOCIAL SECURITY NUMBER (#13) identity element.
MMN PRIMARY VIEW SCORE (#95)	The MMN PRIMARY VIEW SCORE field contains the Primary View Authority Score for the MOTHER'S MAIDEN NAME (#6) identity element.
MULT BIRTH PRIMARY VIEW SCORE (#96)	The MULT BIRTH PRIMARY VIEW SCORE field contains the Primary View Authority Score for the MULTIPLE BIRTH INDICATOR (#39) identity element.
POB CITY PRIMARY VIEW SCORE (#97)	The POB CITY PRIMARY VIEW SCORE field contains the Primary View Authority Score for the PLACE OF BIRTH CITY (#8) identity element.
POB STATE PRIMARY VIEW SCORE (#98)	The POB STATE PRIMARY VIEW SCORE field contains the Primary View Authority Score for the PLACE OF BIRTH STATE (#9) identity element.

Table D-1: Data Stored on the MPI in Austin

## Appendix E: Why Doesn't a Patient Have a National ICN?

### What Causes a Patient Record Not to Have a National ICN Assignment?

#### Answer:

- If the patient record was not included as part of the initial seeding process to the MPI. When the MPI was first initialized, patient records showing no activity in the last three fiscal years prior to the initialization were not enumerated with an ICN.
- If the patient record has not been edited or has not had clinical activity since approximately 1989, it would not have been sent up to the MPI for an ICN and CMOR assignment during the initial seeding of the index.
- If the patient record has not been processed into the system via any of the following PIMS options: Load/Edit, Register a Patient, or Electronic 10-10EZ Processing since the initial seeding of the index.
- Prior to this patch MPIF\*1\*33, the following criteria were not sent to the Master Patient Index (MPI) for national ICN assignment:
  - Patient records with last names beginning with ZZ
  - Patient records that have 5 leading zeros for the Social Security Number (SSN)
  - Patients records with last names beginning with "EEE"
  - Patients records with last names beginning with the word "Merging" (This applies to patients in the process of being merged via the Duplicate Record Merge software.)

Patient records having met these criteria were either prevented from being sent to the MPI or were removed. Thus, these records currently exist in sites' PATIENT file (#2) without a national ICN assignment.

If the patient record had been merged with another.

NOTE: VistA Patch MPIF\*1\*33 removed the Inactivate Patient from MPI [MPIF PAT INACT] option from the Master Patient Index Menu [MPIF VISTA MENU]. This option allowed users to inactivate patient records for any reason as long as they were not shared by another VistA system. Patient records having no activity since inactivation do not have national ICN assignments.

## What Causes a Patient Record to Have Only a Local ICN Assignment?

#### Answer:

- If communication can't be established or is lost with the MPI before the ICN assignment process has completed.
- If the site edits an existing or adds a new patient using an option that doesn't directly interact with the MPI (e.g., VistA Lab or VA FileMan).

National ICN i	s being added to the MPI (via the HL7 ADT-A28 message) as a placeholder until is assigned. A local ICN is assigned to prevent processing the patient again on the at interim period.

## Appendix F: Change to Identity Management Fields, Patch MPIF\*1\*37

In an earlier patch, MPIF\*1\*28, the user was prompted for selected identifying fields in the PATIENT file (#2) early in the Registration process, so the information would be available for the query to the Master Patient Index (MPI) system. Code was added in routine MPIFAPI to accomplish this. This Application Programmer Interface (API) was called by the Registration options that interact with the MPI to ask for the identifying fields.

Patch MPIF\*1\*37 modifications to the API MPIFAPI affects ONLY those fields that are displayed immediately after the prompt: "Please verify or update the following information:." For identity management fields, listed below, this API only prompts for selected fields if they are blank or imprecise in accordance with the following business rules:

- All fields display if they were previously blank.
- Date of Birth field displays if it contains an imprecise date.
- Social Security Number field displays if it is a pseudo number.
- Mother's Maiden Name and Place of Birth (City, State) fields display if the free text field contains extraneous information (e.g., UNKNOWN, NOT AVAILABLE, NOT GIVEN, NOT KNOWN, UNAVAILABLE, or DECEASED, etc.)

With Patch MPIF\*1\*37, the display of the identity management fields, listed below, is conditional based on the criteria outlined in the MPI business rules, listed above.

- Date of Birth
- Sex
- Social Security Number
- Multiple Birth Indicator
- Mother's Maiden Name
- Place of Birth (City, State)
- Alias

## Appendix G: Primary View Identity Traits

The following is the list of fields that are stored in MPI VETERAN/CLIENT file (#985), which is the Primary View of the MPI. The identity traits that comprise the Primary View, which are synchronized back out to the systems of interest, include:

- Name (First, Last, Middle, Suffix)
- SSN
- DOB
- Gender
- Mother Maiden Name (MMN)
- Multiple Birth Indicator (Sent and updated to Primary View as of Patch RG\*1\*45. Added to the list of fields auto-updated [synchronized] in VistA as of Patch RG\*1\*47.)
- SSN Verification Status (Verified, Invalid Per SSA, and null) (Added to File #985 as of Patch MPI\*1\*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of DG\*5.3\*688 [EVC R2].)
- Pseudo SSN Reason (Added to File #985 as of Patch MPI\*1\*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of RG\*1\*47 and DG\*5.3\*653 [EVC R1].)
- Alias (As of Patch DG\*5.3\*756, the ALIAS [#1] multiple in the PATIENT file (#2) will be updated in VistA resulting from the edits made to that information on the MPI by the HC IdM team. The VistA data will be synchronized to match the MPI values. Additionally, when a facility revises their local ALIAS data, the information will be transmitted to the MPI, which in turn will update all treating facilities where the patient is known.)

**NOTE:** Not all Primary View fields are synchronized to the systems of interest.

Name and Number	Description
SURNAME (#1)	Family name, also known as last name.
FIRST NAME (#2)	Patient's first given name.
MIDDLE NAME (#3)	Patient's middle name or middle initial.
NAME PREFIX (#4)	Commonly, Dr., Ms., Sir, or other appropriate titles.  NOTE: Not currently populated on the MPI.
NAME SUFFIX (#5)	Examples are Jr., Sr., PhD, etc.
MOTHERS MAIDEN NAME (#6)	Mother's surname at her birth.
DATE OF BIRTH	Date of patient's birth.

Name and Number	Description	
(#7)		
PLACE OF BIRTH CITY (#8)	Name of the city or town (or nearest) where the patient was born.  NOTE: Not synchronized to the systems of interest.	
PLACE OF BIRTH STATE (#9)	If USA, 2 character state abbreviation. If not USA, the country state. Pointer to the STATE file (#5).  NOTE: Not synchronized to the systems of interest.	
DATE OF DEATH (#10)	The date of the person's death.  NOTE: Not part of the Primary View.	
GENDER (#12)	M for MALE     F for FEMALE	
SOCIAL SECURITY NUMBER (#13)	Patient's Social Security Number (SSN) NOTE: Pseudo SSNs aren't stored on the MPI.	
SSN VERIFICATION STATUS (#14) NOTE: Verified, Invalid Per SSA, and null) (Added to File #985 as of Patch MPI*1*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of DG*5.3*688 [EVC R2].	Status of the verification of a patient's SSN. This value is stored on the MPI, derived from an update from the ESR application after interaction with SSA (Social Security Administration). Possible values synchronized to sites are:  Null  INVALID PER SSA  VERIFIED  Possible values used on the MPI for the ESR correlation are:  NEW RECORD  IN-PROCESS  INVALID PER SSA  RESEND TO SSA	
PSEUDO SSN REASON (#14.1) NOTE: Added to File #985 as of Patch MPI*1*40. Populated to the Primary View of the MPI and systems of interest to the MPI as of RG*1*47 and DG*5.3*653 [EVC R1].)	<ul> <li>Used to document the reason an individual was assigned a pseudo SSN. Available reasons are:</li> <li>(R) Refused to Provide—Individual was asked for his/her SSN but refused to provide the number.</li> <li>(S) SSN Unknown/Follow-up required—Individual is not available to ask/answer the request for SSN. The facility should initiate follow-up activity to obtain the SSN.</li> <li>(N) No SSN Assigned—Individual has not been assigned an SSN. This generally applies to spouse or dependents of veterans who are not US citizens, and infrequently, non-citizen beneficiaries.</li> </ul>	
MULTIPLE BIRTH INDICATOR (#39) NOTE: Added to the list of fields auto- updated in VistA as	The MULTIPLE BIRTH INDICATOR will designate whether or not the patient is part of a multiple birth (i.e. to identify twins, etc.). Possible values are:  • N= NO  • Y= MULTIPLE BIRTH  • Null (Not the same as No)	

Name and Number	Description
of Patch RG*1*47.	
ALIAS SURNAME (#02,.01)	Patient's last name (a.k.a family name). If this patient is known by any name other than that entered in the Name field, enter the other name(s) here.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.
ALIAS FIRST NAME (#.02,1)	Patient's first name.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.
ALIAS MIDDLE NAME (#.02,2)	Patient's middle name or middle initial.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.
ALIAS PREFIX (#.02,3)	Commonly, Dr., Ms., Sir, or other appropriate titles.  NOTE: Not currently populated on the MPI. Once in Primary View, will be an aggregated list from all treating facilities.
ALIAS SUFFIX (#.02,4)	Examples are Jr., Sr., PhD, etc.  NOTE: Once in Primary View, will be an aggregated list from all treating facilities.
ALIAS SSN (#.02,5)	If the patient was also known under a name other than that listed in the NAME field of the PATIENT file (#2), enter the social security number used if different when the patient used this alias.  NOTE: Alias SSNs that are Pseudo SSNs will not be stored on the MPI. Alias SSN is paired with an Alias Name. There can't be just an alias SSN. Once in Primary View, will be an aggregated list from all treating facilities.
RACE INFORMATION (#60)	Enter the race that best identifies this patient.  NOTE: Not synchronized to the systems of interest. Once in Primary View, will be an aggregated list from all treating facilities.
ETHNICITY INFORMATION (#70)	Enter the ethnicity that best identifies this patient.  NOTE: Not synchronized to the systems of interest. Once in Primary View, will be an aggregated list from all treating facilities.
ID STATE (#80)	The following ID STATE definitions are from the Object Management Group (OMG) Person Identification Service (PIDS) Specification. ID STATE designates the status of the entry in the MPI VETERAN/CLIENT (#985) file in accordance with business rules and standards. Values for the patient are:  • P = Permanent  • T = Temporary  • D = Deactivated  PERMANENT: This ID State specifies that all required fields are entered and a national ICN is established. When an ID is created as permanent all mandatory traits <i>must</i> be provided. A permanent ID can be deactivated but <i>cannot</i> be made temporary.  TEMPORARY: This ID State specifies that there are not enough fields to make an entry permanent (as defined further in the business rules). An ID can be created as temporary without indicating any mandatory traits. A common usage is to create an ID that data can be bound to a patient before that patient is identified with an appropriate confidence. A temporary ID can be made permanent or deactivated.

Name and Number	Description
	DEACTIVATED: This ID State specifies that the ICN is no longer used. Once an ID is expected not to be needed any more it can be deactivated (merged or deprecated), which keeps it around for historical purposes. A deactivated ID is in its final state and <i>cannot</i> be transitioned to any other state by PIDS operations, except unmerging.  NOTE: Not synchronized to the systems of interest.

**Table G-1: Primary View Identity Traits** 

### The ALIAS Multiple Stored on MPI and Synchronized to VistA

In the Primary View of the MPI, the ALIAS multiple (#50) is stored in the MPI VETERAN/CLIENT file (#985) as an aggregated list from all the treating facilities associated with that ICN. In VistA, the ALIAS multiple (#1) is stored in the PATIENT file (#2). All edits made by Healthcare Identity Management (HC IdM) staff to the ALIAS multiple on the MPI via the Edit PV Alias Values [MPI DATA MGT EDIT PV ALIAS] option are updated in the Primary View on the MPI and synchronized out to all systems of interest (e.g., VistA treating facilities) for that patient. Site edits to the ALIAS multiple (#1) in the VistA PATIENT file (#2) are updated in VistA and sent to the MPI for updates to the Primary View. The updates are then synchronized back out to all other treating facilities (systems of interest) associated with that ICN.

### **Edits to the ALIAS Multiple Not Scored in Primary View**

The ALIAS identity multiple (#50) has no associated activity score on the MPI. The alias is an aggregated list in the Primary View of all alias information from all the treating facilities and is synchronized with the other treating facilities. If your site adds an alias then everyone will get that alias. If your site deletes an alias entry, then any corresponding entries at the other systems of interest associated with that ICN will remain in primary view, basically requiring HC IdM to become involved to delete an alias value.
